Green Schoolyards America hopes you enjoy this publication! We also invite you to download a free copy of an international companion guide with additional school ground activities. The *2015 International School Grounds Month Activity Guide* is published by our colleagues from the International School Grounds Alliance: www.internationalschoolgrounds.org

Green Schoolyards America is fiscally sponsored by Architects/Designers/Planners for Social Responsibility, a 501(c)(3) corporation.

GREEN SCHOOLYARDS AMERICA is a national organization that expands and strengthens the green schoolyard movement and empowers Americans to become stewards of their school and neighborhood environments. We believe that school grounds are uniquely positioned to enrich the daily lives of children and their communities, occupying both the geographic and social heart of almost every city across the USA and around the world. We provide resources, training and support for pre-K-12 school districts and partner with nonprofits, businesses, government agencies and utilities to effect change across the country.

We invite like-minded professionals and organizations to join us in this work and collaborate to nurture and grow the international movement to green school grounds. To sign up for our mailing list, please visit our website:

Introduction

WHAT ARE LIVING SCHOOLYARDS?

When you think about typical schoolyards, what image first comes to mind? For many people, school grounds are places covered by paved surfaces and manicured sports fields, adorned with a few, simple shrubs and trees, and one or two ordinary climbing structures. Most school grounds look the same, with very little variation to reflect unique aspects of each school community, the neighborhood’s ecological or geographic context, or teachers’ preferred curricula.

Children are masters at reading what Wendy Titman calls the “hidden curriculum” of school grounds, and understand the value adults place on them through the level of care given to their surroundings. The messages most traditional schoolyards send children about their place in the world is not reassuring—particularly in our cities where many school sites are filled with asphalt and are home to very few living things.

Outside of school, spaces children can explore on their own have been shrinking over the last few generations, reducing children’s domain from miles of free ranging territory to

the limited zone between home and the end of the block. Schoolyards are now one of the only places many children are allowed to play outdoors on a daily basis, and they are increasingly important for fostering children’s health and development. With this in mind, schools have a special responsibility to provide the next generation with outdoor experiences that help them develop their curiosity, their sense of adventure, a healthy lifestyle and a love of nature.

A green or “living” schoolyard movement is gaining momentum around the globe and has the potential to improve the lives of *every child, every day*. Schools are reshaping their traditional yards, designed for 1940s educational methods, and creating beautiful, ecologically diverse landscapes with an eye toward the future. Schoolyard greening creates rich environments that connect nature and environmental sustainability with place-based learning, hands-on curricula, and imaginative play, while also building community.

The movement is growing around the world, and we invite you to join us in this vitally important work.

WHY ENRICH SCHOOL GROUNDS?

Teach Place-Based Understanding. Living schoolyards provide opportunities for students to tune in to their surroundings and get hands-on experience with nature while gaining a better understanding of their own neighborhoods. They help children mark the seasons with changes in wildlife migrations, colorful leaves in autumn, and the length of shadows on the ground. They bring watershed education to life, as classes step outside when it rains to watch the rain flow off their school building, through a downspout, and out into the school's rain garden or cistern. Many excellent, low-cost educational resources sit right outside the classroom doors, waiting to be tapped.

Practice Stewardship. Ecologically-rich schoolyards address important environmental issues in ways that even young children can participate in and understand. Students can identify place-based environmental concerns themselves and become empowered to repair them, enriching their own corner of the world with their ingenuity. While these individual actions may be small, together these projects can fundamentally improve the local environment and profoundly change the way that students understand their place in the world. This is an inspiring and optimistic way to approach the field of environmental education.

Foster Adventure, Wonder and Health. Green schoolyards foster children's social, physical and intellectual growth by providing settings for imagination, exploration, adventure and wonder, and serve as dynamic environments in which to run, hop, skip, jump, twirl, eat and play in active, challenging and creative ways. Enriched school grounds provide child-driven, play-based solutions to the obesity epidemic and can promote healthier lifestyles through increased physical activity and nutrition-oriented gardening and cooking programs.

Engage the Community. Living schoolyards teach ecological literacy, invigorate children's bodies, open and inspire young minds, and knit our communities more closely together in the process. Successful green schoolyards are the product of many hands that harness the collaborative potential of their school communities. Like the barn raisings of previous generations, cooperation among community members reinforces interdependence, local self-reliance and a sense of community creating useful, beautiful places at low cost. When parents, teachers and students work together to improve their school and grounds, they foster closer relationships that in turn support student achievement and well-being. This movement shifts the way our society views these important, shared public spaces, and supports school district land management efforts with the energy of community partners.

The transition from a traditional, paved schoolyard to a living schoolyard can be dramatic and opens up a variety of opportunities for children to learn, play and explore.

© SHARON DANKS

MODEL THE FUTURE YOU WOULD LIKE TO SEE

Well-designed green schoolyards model the ecologically-rich cities we would like to inhabit, at a smaller scale, and teach the next generation how to live more lightly on the Earth—shaping places where urbanization and nature coexist and natural systems are prominent and visible, for all to enjoy.

They inspire students and their communities with organic food production, wildlife habitat, energy conservation and production, rainwater collection and management, sustainable design practices and creative artwork. By teaching students to explore their environment with their hands, hearts, and minds—whether they are climbing into a tree house or tackling the challenges of the surrounding world—living schoolyards help us to plant seeds that will blossom as children grow up and help to shape an ecologically literate society.

We are all important participants of the green schoolyard movement. You can help it reach its potential to touch children in every neighborhood—by starting with your own. Get a conversation going with your neighbors, the principal at your local school, and your school district administrators. Dream of the school environment you would like to see for our children, and then help to shape this reality at your local school. The schoolyards of tomorrow will be what you and your community make them.

Environmental planner Sharon Gamson Danks is CEO of Green Schoolyards America, based in Berkeley, California. Her work transforms school grounds into vibrant public spaces that reflect and enhance local ecology, engage the community, and nurture children as they learn and play.

Living Schoolyards for California

The movement to enrich outdoor learning environments on school grounds and connect children with nature took an important leap forward with the adoption of a new California state resolution. The resolution encourages school districts across the state to design and construct schoolyard green spaces and use them to teach academic curricula outdoors. Authored by Assemblymember Phil Ting of San Francisco, the Living Schoolyard Month resolution (ACR-128) adopted on June 16, 2014, also establishes an annual statewide celebration of school grounds to be held each May.

Support for vibrant outdoor classrooms has been gaining momentum over the last two decades in California, across the USA, and around the world. California has been a national leader in the school garden movement since 1995, when then-Superintendent of Public Instruction Delaine Eastin collaborated with chef Alice Waters to create the Garden in Every School initiative through the California Department of Education. In 1999, the state established the Instructional School Gardens Program (AB 1014) to support garden-based learning. Over the years, tens of thousands of children have enjoyed school gardens inspired by these

efforts, and learned firsthand about horticulture, nutrition and a variety of academic disciplines. To promote continued growth of these programs, California passed legislation in 2006 (AB 1535) that provided a total of \$15 million in school garden grant funds for equipment, supplies, and related professional development for 3,500 school sites.

The new Living Schoolyard Month resolution is an important milestone in California's approach to promoting outdoor green spaces for all children in K-12 public schools and for the state's thriving green schoolyard movement. Building on the success of previous school garden programs, it expands the depth and breadth of outdoor education beyond horticulture and nutrition to connect schoolyard greening to the health of urban ecosystems, child development needs, and the quality of life for students and their school communities.

CONNECTION TO SCHOOLYARDS ABROAD

California's adoption of Living Schoolyard Month holds great promise for children throughout the state and is also significant for the wider, international green schoolyard

movement because it highlights the ongoing dialogue between efforts in California and those in other states and countries.

California's resolution was strongly influenced by the Westerbeke Declaration on School Grounds, produced by a global nonprofit organization called the International School Grounds Alliance (ISGA). Written collaboratively by leaders in the school ground field from thirty-one organizations in seven countries, the Westerbeke Declaration expresses a vision for using school grounds to improve children's well-being. The adoption of ACR-128 marks the first time the Westerbeke Declaration has inspired public policy, and it is hoped that the message it expresses will resonate with institutions in other states and countries in the years to come.

The annual celebration component of California's Living Schoolyard Month is also intentionally aligned with ISGA's annual May festival, International School Grounds Month, so students around the world will celebrate their school grounds simultaneously.

HOW CAN YOU GET INVOLVED?

Public support is very important to the success of green schoolyard programs. Whether or not you live in California, you can:

- Plan a project to enrich your schoolyard or assist a local school by volunteering on a schoolyard work day
- Organize events to celebrate and use your school's existing green space
- Spread the word about Living Schoolyard Month
- Recommend that your city government include schoolyard ecology as a component of their green city plans
- Encourage your school district to support ecological schoolyards and outdoor classrooms that improve children's learning and play environments and enhance neighborhood ecology
- Put the activities in this *Guide* to good use with PreK-12 students at your local school
- Write about your May celebrations of Living Schoolyard Month and share them with us at: info@greenschoolyardsamerica.org (See page 6 for details.)
- Join California's statewide Living Schoolyard Network by contacting Sharon Danks (Green Schoolyards America, info@greenschoolyardsamerica.org) or Teresa Lees (CREEC, teresa@creec.org).

With your help to spread the word in California and around the world, the Living Schoolyard Month resolution will bring the benefits of green schoolyards to an increasing number of schools, and thousands more children will go outside to learn, explore and discover the world just outside their classroom door.

Celebrate in May!

May 2015 is the first annual celebration of Living Schoolyard Month! We encourage schools across California and beyond to take their students outside during the month of May—and throughout the year—to celebrate their grounds and use them for hands-on learning, place-based inquiry, recreation, environmental stewardship and community-building.

This guide was created in honor of the first Living Schoolyard Month. It was developed by Green Schoolyards America in collaboration with our colleagues from organizations across California, who have contributed a wide range of ideas to help schools bring students outside and use their school grounds to their fullest.

We hope schools will celebrate this special month using the ideas in this guidebook and other activities they develop themselves based on their own curriculum and context.

After your school has participated in Living Schoolyard Month, please tell us about your adventures by following the directions in the green box, to the right. This will help us share the results of this first celebration with the public and build more interest in green schoolyard work in the years to come.

SHARE YOUR CELEBRATION

Please share your Living Schoolyard Month celebration by sending us the following information:

- Contact name and email address
- Name of your school
- School location: city, state, country
- Age range and number of participating students
- School or project website (if you have one)
- A brief description of how you celebrated Living Schoolyard Month (100-200 words)
- Photo(s) showing your activity in progress. (Please confirm you have permission to use these images and to share them with the public in print and online.)

Email this to: info@greenschoolyardsamerica.org

Following the event, we will share many of the activity reports we receive with the public online. We are looking forward to hearing about your work and hope you enjoy the celebration!

Art

Living schoolyards provide settings and inspiration for creative projects ranging from writing assignments to drawing, painting, mosaic, nature art and sculpture.

BEAUTY Outdoor art installations turn ordinary schoolyards into beautiful, memorable places that delight the eye and speak to the heart, while also showing students the school community cares about the environment they share. Temporary and permanent schoolyard artwork can reflect local culture, showcase the natural environment and instill school spirit.

STUDIO SPACE Students of all ages benefit from art studio spaces that allow creativity to blossom—and that are easy to clean, comfortable, inviting and spacious. Living schoolyards can include formal or informal outdoor art studios that increase teaching space and accommodate messier art forms that are more difficult to practice inside.

CREATIVE EXPRESSION Schools can diversify the recreational offerings they provide to students of all ages during their outdoor free time by including an array of inexpensive, outdoor art materials among their supplies. Unstructured “art time” allows students to get their hands dirty and express themselves creatively in ways that are not always possible during the rest of the school day.

ACTIVITIES IN THIS CHAPTER

- *Make a Create-With-Nature Zone* 8
Art class or recess activity (3-18 years old)
- *Creative Painting with “Garden Paintbrushes”* 9
Art class or recess activity (3-18 years old)
- *Painting the Seasons* 10
Art class activity (4-18 years old)
- *Nature’s Watercolors* 11
Art class or recess activity (5-10 years old)
- *Bird House Building* 12
Art class activity (8 years old and up)

OTHER RELATED ACTIVITIES

- *Schoolyard Nature Lotería* 18
Board game (6-17 years old)
- *Make a Solar Etching* 49
Art class activity (8 years old and up)
- *Object Match Challenge* 35
Nature journaling / science / writing (9-18 years old)

MAKE A CREATE-WITH-NATURE ZONE

AGES

All ages

CONTRIBUTED BY

**Zach Pine Nature Sculpture and
University of California Blake Garden**
Kensington, California
www.naturesculpture.com
www.laep.ced.berkeley.edu/blakegarden

© ZACH PINE

Make a Create-With-Nature Zone to support creative play and construction using found materials from nature. The Zone can be set up and used for a one-time Create-With-Nature event, or installed permanently in a playground or outdoor classroom to be used during recess with minimal supervision or to support instructional time. Create-With-Nature Zones usually have agreed-upon rules or expectations, sometimes printed on a sign.

MATERIALS

- Collect natural materials from school grounds, such as fallen leaves or twigs, or green waste from a school garden. Ask children to bring additional materials collected in an environmentally sensitive way, from home. Example materials include: leaves, rocks, sticks, flowers, cones, fronds, seeds, pods, wood, shells, evergreen needles, stalks, bark, seaweed, sand, mud and water.
- The size, types and amount of natural materials should be tailored to the age group and to the size of the Zone.
- A slight scarcity of materials can promote creativity, collaboration and sharing. Some materials can be kept in reserve to add in if needed.
- Tree stumps or rounds, to show the boundaries of the Zone and provide work surfaces or seating, can be obtained free-of-charge from tree service companies and public parks and gardens.

DIRECTIONS

- Create the Zone's borders using chalk lines, tree stumps, benches, planters or existing walls and pathways. A cozy Zone promotes sharing, inspiration and collaboration.
- Include a "nature library" along the edge of the Zone to lay out and sort the natural materials. Bins or baskets are helpful to store, transport and collect items for use.
- If the Zone is not on pavement, provide a few flat surfaces such as stepping stones or tree rounds to highlight small objects that are less visible on grass, dirt or mulch.
- Orient students to the Zone. The purpose is to have fun while engaged in the activity, not to make something permanent. You can model this by making a creation, then quickly "recycling" it, making a new one from the same materials, and repeating this process a few times. You may introduce age-tailored vocabulary such as: under/over, symmetrical/asymmetrical, abstract/representational.
- You may want to make a "rule" that materials should be put back in the "nature library" at the end of a session. Make it clear whether foraging from nearby nature is encouraged or not, and what the expectations are for protecting the environment. If the Zone is permanent, post a sign explaining how the Zone should be used.
- The Zone can also be used as an outdoor classroom to achieve curricular goals in all subject areas, using structured activities and assignments.

CREATIVE PAINTING WITH “GARDEN PAINTBRUSHES”

AGES

All Ages

CONTRIBUTED BY

Explore Ecology
Santa Barbara, California
www.exploreecology.org

© BIANCA PISANO

Students search the schoolyard garden for two natural items to use as paintbrushes. After finding their own place to sit in the garden, students paint a picture using their “brushes.” Then all students come together, share their artwork, and discuss whether or not their paintbrush worked the way they thought it would and why.

MATERIALS

- Paper
- A variety of natural materials to use as paintbrushes
- Tempera paint
- Clipboards

DIRECTIONS

- Instruct the students to search the garden for two twigs, leaves, fruits or other natural items to use as their paintbrushes (about 5 minutes).
- After each student has found a paintbrush, give each person a clipboard, one or two pieces of paper and one or more cups with paint in them. Students can show each other their brushes while they wait for everyone to get settled.
- Instruct the students to find a place by themselves where they can sit peacefully and undistracted. Once everyone has found a comfortable place, instruct them to close their eyes and detect smells or sounds around them. (30 seconds)
- Ask each student to create a painting inspired by their setting, or assign them to create a piece of art with a given natural theme. For example, ask them to draw their favorite place in nature. (10-20 minutes painting time, depending on age)
- If some students finish early, they can sit in their special spot and continue to observe the nature around them. When the time is up, ask the students to gather and share their artwork. It is nice to have each student stand up, present their work, and describe what they painted.
- Complete the session with a discussion of the success, or problems with, the paintbrushes they chose. Explore why each paintbrush worked or didn't work as expected.

PAINTING THE SEASONS

AGES

4-18 years old

CONTRIBUTED BY

Green Schoolyards America

Berkeley, California

www.greenschoolyardsamerica.org

Students select a place in their schoolyard that they will visit once each season to draw or paint the plants and trees as they appear in that month, and then compare them to their drawings of the same place at other times of the year. Materials and techniques used can vary with the students' ages.

MATERIALS

- Watercolor paints and paint brushes, colored pencils, crayons or oil pastels
- Paper suitable for painting or drawing
- One clipboard per student

PREPARATION

- Select a location in your schoolyard to act as a temporary art studio. Find a space large enough to seat the whole class on the ground, near plants with a variety of shapes, sizes and textures. Look for an area that includes deciduous trees or perennial shrubs that lose their leaves in the winter, flower in the spring, leaf out in the summer and/or change color in the fall.

DIRECTIONS

- Bring the class outside to the selected “art studio” and ask each student to find a comfortable place on the ground, near a plant or tree that they find interesting.
- Give each student a clipboard prepared with paper, and their own drawing or painting supplies.
- Ask the students to draw what they see using whatever type of drawing or painting technique is appropriate for their age. Younger students can focus on the basics of drawing from life and capturing the colors of the season. Older students may work on more complex techniques such as detailed scientific illustrations, perspective drawings or refined watercolor techniques.
- Ask each student to create two drawings or paintings: one that focuses on a plant detail, such as a small group of leaves or flowers, and another picture that shows a wider view, with the whole plant or tree in the image. Students can also try to represent the colors they see as accurately as possible.
- Revisit the same site and use the same drawing or painting techniques twice more during the school year, to capture seasonal changes in color and form, as they occur.
- When the third set of drawings and paintings are finished, display the artwork as an exhibit that illustrates the changing seasons on your school grounds.

NATURE'S WATERCOLORS

AGES

5-10 years old

CONTRIBUTED BY

Ayesha Ercelawn

La Scuola, Italian International School

San Francisco, California

www.lascuolasf.org

© AYESHA ERCELAWN

In this art activity, children grind leaves and flowers with mortars and pestles to extract their beautiful colors. They love the physical process of crushing plants and are intrigued to find that the shades of color emerging are not quite what they expected. This can also be a sensory activity if fragrant herbs are used, can connect to the botanical sciences in the classroom, be looked at through the lens of traditional art materials, or be used as an example of biodegradable and sustainable art materials.

MATERIALS

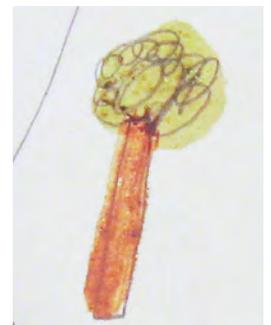

- Mortars and pestles (or small cups and sticks)
- Heavy paper such as construction or watercolor paper
- Paintbrushes
- Water in a small container
- Artist paint palettes
- Leaves and flowers

DIRECTIONS

- Demonstrate how to use a mortar and pestle by grinding 4-5 leaves with a few teaspoons of water. (Try this beforehand since some leaves work better than others.)
- Let the children gather leaves and flower petals from the schoolyard to try making their own colors. They can experiment with one plant material at a time or see what emerges when they combine different leaves or flowers. Try not to let them dump a lot of water in since the delicate colors will be too diluted.
- Have small pieces of paper available for children to test their colors and see if they like the shade they created or if they want to keep grinding.
- Share all of the students' different colors by pouring a little bit of each child's watercolor into a communal artist's palette for all children to use, together.
- Finally, pass out heavy duty paper and let the students start creating their paintings!

NOTES

- To extend this activity, you can also provide strainers and containers to extract just the liquid color. These colors will keep for a few days in the refrigerator without spoiling, or you can study the process of spoiling (and discuss preservatives, refrigeration, etc.) by keeping them on a shelf to watch how the colors change with age.
- Many soils also make beautiful colors.

BIRD HOUSE BUILDING

AGES

8 years old and up

CONTRIBUTED BY

Waldorf School of the Peninsula
Los Altos, California
www.waldorfpenninsula.org

© WALDORF SCHOOL OF THE PENINSULA

Building a bird house (or bat house) is a great project. At Waldorf School of the Peninsula, students build a bird house in Grade 4 during the winter months. This activity helps develop coordination and introduces bird ecology.

SUPPLIES

Building Materials:

- Redwood fence boards, 1”×6”, 6’-8’ long (4.5 linear feet required per bird house), that are green and lightweight (not heartwood) with few knots and blemishes. It is best to use a wood that does not require treatment, including stains and oil.
- Small scrap wood to protect the bird house from clamps
- Nails: 5 Penny d nails

Tools:

- Hand turned drills (2-3 for the class), with bits for making the birdhouse hole and bits for the latch nail. The larger drills for making the bird house holes are more durable and the drill bits are larger and stronger.
- 1 per student: Metal T-square rulers, small wood handled saw (type that cuts on the push and pull stroke), lightweight hammer, metal clamp, pencil

Work environment:

- Groups of 3-4 students work on 2 sawhorses (more than 4 students is unsafe)
- Safety goggles

DIRECTIONS

- Each type of bird requires a different type of house, with specific dimensions. Begin by researching what kind of birds you are hoping to house in order to select a species that lives in your area and to understand its needs.
- At our school, students are given one full class day to practice measuring, sawing and hammering on scrap

wood before they begin. An alternative is to bring several adults for assistance.

- There are many good plans for bird houses. Here is a link to the plans we use: www.bygpub.com/bluebird. At our school, the teacher learns to build the bird house and uses the plans for reference. We do not provide the students with copies of the directions but instead show them a finished bird house and ask them to deconstruct it in their minds. When helping a student with the next step, other students watch and see if they can then accomplish the task on their own.
- In the plans, you are directed to cut some of the boards down to 4 inches wide. Experienced students can cut the boards themselves if boards are first cut to the proper lengths.
- On nailing and finish work: Instruct the students to pull out any nails that are not true. Nails must be “flush” with the boards and the boards must be “flush” with each other, not showing large air gaps and mistakes. Cuts that are not straight must be fixed. Bird houses are rasped, sanded and holes are patched with wood putty. Cracks are fixed with wood glue. Our goal is to make them beautiful as well as functional.
- Students take the bird houses home when everyone is finished, which encourages the students to support each other in finishing their work. If students finish early, they team up to build another one for the school garden.

Adapted from Carolyn Brown and Anastasia Sinclair, “Bird House Building: Grade 3-4+,” Waldorf School Gardens of the Bay Area and Beyond. www.waldorfschoolgardens.com/lesson-plans/bird-house-building

Recreation

Living schoolyards encourage exploration, imagination, relaxation and free choice among a variety of recreational options, from ball games and climbing equipment to informal play in bushes, trees and flowers. They include space for traditional sports and games with rules created by adults, as well as places for children to dream up their own games without adult involvement.

Rich, interesting, well-designed green schoolyard spaces invite children to climb and run and swing and balance, to dig and pretend and create. They lend themselves well to creative play with art materials, musical instruments and performing arts. Their planted areas invite kids to engage in open-ended “nature play,” find the little creatures that live in the soil, and unwind and explore “far away lands” with their best friend from the comfort of a cozy corner of the schoolyard. (Danks, 2010)

School grounds can also become shared community resources after hours, providing multi-use, public open space within walking distance of every neighborhood. They are often the sites of annual school and community festivals and can be used creatively outside of school hours and on weekends.

ACTIVITIES IN THIS CHAPTER

- *The Nature Swap* 14
Imaginative play (2-8 years old)
- *Nature Elements in the Landscape* 15
Playscape construction (3-18 years old)
- “Everybody’s It” Tag 16
Cooperation game (5-11 years old)
- *Jump the River* 17
Coordination game (5-11 years old)
- *Schoolyard Nature Lotería* 18
Board game (6-17 years old)
- *Lighthouse* 19
Cooperation game (9-12 years old)
- *Photosynthesis Tag* 20
Science game (9-13 years old)
- *Family Camp Out in the Schoolyard* 21
Family time (6-17 years old)

OTHER RELATED ACTIVITIES

- *Steal the Native Plant* 32
Plant identification game (8 years old and up)

THE NATURE SWAP

AGES

2-8 years old

CONTRIBUTED BY

Nature Kids Institute
Orangeville, California
www.naturekidsinstitute.org

© NATURE KIDS INSTITUTE

Transform your plastic and unimaginative playthings into unbridled creativity by replacing play accessories with nature's loose parts!

© SHARON DANKS

© NATURE KIDS INSTITUTE

MATERIALS

- Leaves, sticks, pine cones, rocks, acorns, pine needles, seashells, flowers, seed pods and other natural materials.

DIRECTIONS

- This activity restores a child's right to imagine and create their own fun! Does your play space for young children contain a play kitchen with plastic food? How about a toy barn full of animals, a doll house with dolls, or even a painting easel with brushes? If so, it's time to let nature shake things up!
- Leave the play kitchen but remove the food, leave the barn but remove the animals, leave the doll house but remove the dolls, and (our absolute favorite) leave the painting easel but remove the paintbrushes.
- Challenge children to find their own "food," "animals," "dolls" and "paintbrushes" using natural elements found around the school or natural materials that you provide.
- You will be amazed by how creative children can be when they are not limited by the manufactured toys we offer them. Suddenly, little chefs are able to cook up anything they want, unheard of animals move into the barn, dolls become free to embody the full range of human diversity and behavior, and painting becomes a much more complex and tactile experience. In this play scenario, the creative decisions come from within the child instead of from without.

NATURE ELEMENTS IN THE LANDSCAPE

AGES

3-18 years old

CONTRIBUTED BY

Bay Tree Design, inc.
Berkeley, California
www.baytreedesign.com

© LISA HOWARD

Students greatly benefit from having natural elements in their schoolyard landscape that they can explore and use—depending on their age—to enhance their imaginative play, develop gross motor skills, incorporate into their academic studies, or enhance informal relaxation spaces. This project places boulders, tree rounds or logs in the schoolyard landscape. It is intended to be undertaken during a community workday or by school district facilities staff or a hired contractor.

MATERIALS

- Tree rounds or logs from long-lasting hardwoods like cedar or redwood; minimum 18” diameter x 18” long
- Boulders, a minimum of 18” in diameter
- Open-graded aggregate base rock, to place under the logs
- Winch, tripod, digging bar and other appropriate tools
- Work gloves, safety glasses and any other safety equipment deemed necessary for the activity
- Adults to supervise children, if they are involved, and to keep children’s participation safe and age appropriate
- Insurance for volunteers, via the school, district or PTA
- Camera

CONSIDERATIONS

Select a location in a soft, landscaped area and decide if you will use boulders and/or tree rounds or logs. When placing these natural elements onsite, consider: the ground surface, nearby traffic and use patterns, drainage and desired uses. If these elements are intended for play they should follow the CPSC and ASTM guidelines for safety. All materials should be onsite before work begins.

DIRECTIONS

- Recruit adult volunteers from the school community to assist with construction and lend tools to the project.
- To place tree rounds:
 - Mark the ground to indicate where you wish to place the elements. Explain this layout to the assembled volunteers. Dig holes in the soil that are a few inches wider than each tree round you will be using, following your plan. The holes should be deep enough to accommodate a 6” bed of compacted base rock plus half the height of the tree rounds.
 - Fill the holes with 6” of base rock; compact it firmly. Place the tree rounds in the ground, with at least half the height below the finished grade and the other half above ground. Fill the hole around each piece of wood with additional base rock up to 3” below finished grade, and compact firmly. Add wood chip mulch to the top of the holes to match the surrounding landscape.
- To place boulders:
 - Place boulders in the ground on compacted native soil, at least 1/3 below the finished grade with the other 2/3 exposed above the finished grade. Fill the holes with native soil and top with mulch, as desired.

“EVERYBODY’S IT” TAG

AGES

4-10 years old

CONTRIBUTED BY

Playworks

Oakland, California

www.playworks.org

© PLAYWORKS

This twist on a classic game of tag will get kids moving and help develop their hand-eye coordination and spatial awareness. This activity is best for a large group of kids (10 or more).

© LISA HOWARD

MATERIALS

- No materials are necessary for this activity, but adult leaders should establish boundaries in a relatively small, safe area so that constant motion is encouraged.

PREPARATION

- Demonstrate safe tagging: light touch, like a butterfly’s wings, on the shoulder
- Explain and avoid unsafe tagging: hard contact that might cause the person being tagged to fall
- Review the boundaries and the consequences for going outside them. Students who go out of bounds will have their count started over from zero and will need to perform 10 jumping jacks to get back into the game.

DIRECTIONS

- The object is for players to tag other players and keep a running count of everyone they touch in three minutes.
- No one person is “it” and no one stops playing or “freezes” when tagged.
- Variations:
 - Adjusting the length of the game and the location of the boundaries, between rounds, can add fun and variety.
 - If someone is tagged, they must subtract one from their running tag count.

JUMP THE RIVER

AGES

4-7 years old

CONTRIBUTED BY

Playworks

Oakland, California

www.playworks.org

© PLAYWORKS

This fun jumping game brings play into the classroom. Teachers can integrate this game into lessons about rivers or ways people travel. During the activity, children learn and practice different jumping skills. The game can also be adapted for indoor use.

MATERIALS

- Jump ropes and chalk
- Optional: hula hoops, small logs or “found objects”

PREPARATION

- Arrange “obstacles” like sticks or small logs on the ground, or use jump ropes arranged in two lines, to create “terrain” for players to jump over. Obstacles can also be represented by chalked lines on the pavement. If you have an actual stream in the area you are using, that works well, too!

© SHARON DANKS

DIRECTIONS

- Explain to the children that they are taking a walk in the woods and may need to cross a stream or river. Ask the children to walk throughout the prepared space and when they come to a “river” (the objects or chalk lines on the ground) they need to jump over it without getting their feet wet. Children should work independently.
- When landing, children should land on two feet spreading their feet about shoulder width apart so they have a wide base of support when they land. After landing, children should proceed to and jump over the next river. Emphasis should be placed on landing on both feet at the same time without falling over.
- Indoor version: Ask children to draw or paint their own rivers on large sheets of paper. Securely tape children’s drawings to the floor and pretend that the class is going on a trip. When children reach the different rivers scattered throughout the room they must swing their arms and jump over the river, landing on the other side without falling over.

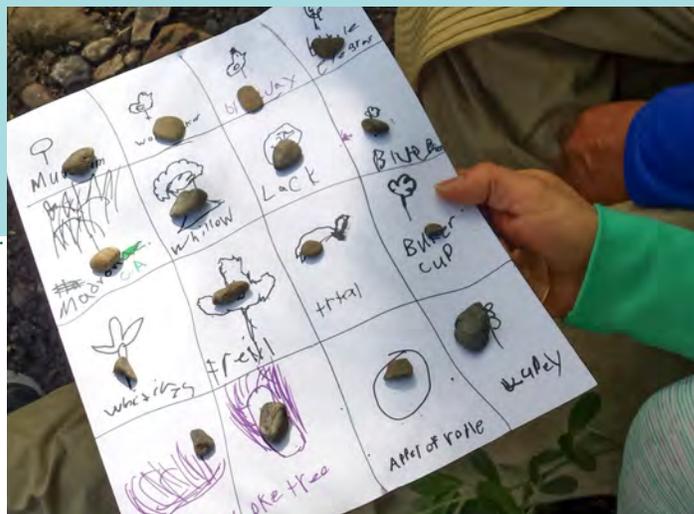

SCHOOLYARD NATURE *LOTERÍA*

AGES

6-17 years old

CONTRIBUTED BY

Latino Outdoors
Capitola, California
www.latinoooutdoors.org

© LATINO OUTDOORS

Lotería is a traditional game played in many Spanish speaking countries that is somewhat similar to bingo. Kids can make their own nature-themed *lotería* cards and *tablas* (game boards) using their schoolyard or backyard for inspiration. Teachers can help students to make a collaborative class set and/or personalized, nature-themed *lotería* games to take home.

MATERIALS

- To make one *lotería* set for the class, you will need at least 2 blank index cards per child, of any size. You will also need one full sheet of cardstock (8½" x 11") per child, to use for the *tablas*.
- Drawing and coloring materials and glue for each child
- A class set of counting chips, for use while playing the game. This can be anything from bottle caps to beans or a favorite type of dried seed found in your schoolyard.

DIRECTIONS

- First, bring the class out into the schoolyard to explore, play and identify what they see! Ask the children: What kinds of trees grow at your school? Which animals visit or live there? Which insects? What type of plants do you see? Do you see birds, a lizard or a cat walking by? Ask students to make a list of everything they see, from the grass they can touch to the birds that fly away.
- Second, ask the children to draw what they observed, and make colorful pictures of the plants and animals in your schoolyard. They can pick other favorite objects, too. Give each student two cards. Ask them to draw one animal, plant or object per card and label each card with a descriptive name. If they know how to translate their label into Spanish, their cards can have both the English and Spanish words for the plant, animal or object they drew (e.g.: *El Gato*, The Cat). Ask Spanish-speaking parents or students to help with the translations. Visit the schoolyard as many times as needed to draw a full set of 54 cards (or more) with the class.

- To create the *tablas* (game boards), make photo copies of the hand drawn cards at a reduced scale (2" x 2.5"), and ask children to paste the small versions of the drawings onto their 8½" x 11" paper to create a grid of pictures, in random order, with 4 rows and 4 columns. (See photo) Each child will need 16 small images for their *tabla*.
- Next, play *lotería* in the classroom or outside in the schoolyard. To begin, the leader holds the deck of cards and picks one card at random from the stack. He or she calls out the name of the card (as written) and shows everyone the picture. Children playing the game place a counting chip on the matching space on their *tabla* if their *tabla* has that image. The first child to cover 4 squares on their *tabla* in a horizontal, vertical or diagonal row (or fill 4 corners or a small square group of 4) is the winner of the game and shouts "¡Lotería!" (Lottery!)
- Students can also work in small groups to make their own full set of place-specific *lotería* cards and *tablas* and use them to play with their parents and other members of the community, reinforcing the identification of nature in the schoolyard while spending time together in an enjoyable social activity that connects generations.

LIGHTHOUSE

AGES

8 years old and up

CONTRIBUTED BY

Life Lab
Santa Cruz, California
www.lifelab.org

© JOHN FISHER

This activity asks one student (the lighthouse) to verbally lead another blindfolded student (the boat) through a maze of people. This pairs well with class discussions around communication and cooperation skills.

MATERIALS

- Blindfold

DIRECTIONS

- Ask for a student who feels that he or she can communicate clearly to be the lighthouse.
- Ask for another student who considers himself or herself to be a good listener to be the boat. Blindfold this student.
- The remaining students will become obstacles in a bay. They can be bridges, logs, and so on. It is important that they are quiet and do not move during the activity.

- Situate the lighthouse at one end of the playing area.
- Place the boat at the other end.
- The remaining students can take their places between the boat and the lighthouse as obstacles in the bay.
- The task of the lighthouse is to verbally lead the blindfolded boat through the obstacles. The lighthouse should remain stationary. The lighthouse should give the boat explicit directions so that it will avoid the obstacles. It may help to have the boat keep a hand raised to assist in determining left from right.
- The task is completed when the boat safely arrives at the lighthouse. If the boat hits an obstacle and sinks, choose another student to be blindfolded, rearrange the obstacles and begin again. The obstacles should remain still and silent.
- Possible discussion topics after this activity:
 - How did it feel to be the boat?
 - What did the boat have to do to stay afloat and reach the lighthouse?
 - How did it feel to be the lighthouse?
 - What did the lighthouse have to do to bring the boat in safely?
 - What does “concentration” mean?
 - What does “communication” mean?

PHOTOSYNTHESIS TAG

AGES

9-13 years old

CONTRIBUTED BY

**Los Angeles Unified School District
Office of Outdoor and Environmental Education**

Los Angeles, California

www.outdooreducation.org

© SHARON DANKS

In this activity, students learn about the components and process of photosynthesis while practicing cooperative learning skills and playing a game of tag. The game explains the ingredients necessary for plant survival. The object is for the “trees” to get everything they need in order to make glucose (earn a Skittle or other sweet treat) and survive.

MATERIALS

- Green, yellow, blue, brown and red string
- Bag of Skittles or other small, sweet treats

DIRECTIONS

- Explain the concept of photosynthesis and the process by which leaves create energy for plants.
- Show the students the collection of string and explain what each color stands for: yellow for the sun, blue for water, red for carbon dioxide (CO₂) and brown for nutrients. These are the components needed for a tree to survive.
- Choose a few students to be the “trees” in this game of tag, so approximately one person in six is a “tree”. Give each “tree” a green string to tie on their wrist in a manner that is easily released. The “trees” will be the only ones who can try to snatch the other students’ strings.
- Once the “trees” have been selected, have the other students choose which photosynthesis components they would like to be. Note: allow the students to choose whichever component they would like to be, even if all of them choose the same color. This can be discussed at the end of the game.
- Ask the “components” to tuck their strings into their back pockets or the back waistband of their pants. They should not tie the string on their body in any way. The hanging strings will look like a tail. The object is for the “trees” to get everything they need in order to make glucose.
- To play the game, the “trees” chase the “components” and try to snatch their “tails”. Once a “tree” has everything needed to make glucose they take their catch to the leader and explain what they have collected. The students cannot just hand the strings to the leader. They must explain what each color represents. Once the student (“tree”) has answered correctly, give them one Skittle. Round one should last about five minutes.
- When round one is over ask the students to sit down and discuss what happened in the game. Did one or more “trees” survive? Why or why not? (In order to survive, they must have had a least one Skittle.) If most students chose “water”, discuss what happens during floods. Explain that if there is too much of something, like water, the trees cannot survive. Trees get uprooted, nutrients get diluted or washed away.
- Play a second round. Choose different students to be the “trees”. During the second round, if a string gets taken, the student can get another string of any color and keep playing. As “trees” turn in their components, add another “tree”. Do not tell the students at the beginning of the round that more trees will be added, they will begin to see what happens as “trees” turn in their components. This can be discussed during the wrap-up. This round should also only last five minutes.
- At the end of round two discuss the results. What happened when there was an unlimited amount of components? How many trees survived? What would happen if the game continued?

FAMILY CAMPOUT IN THE SCHOOLYARD

AGES

6-17 years old

CONTRIBUTED BY

Outdoors Empowered Network
San Francisco, California
www.outdoorsempowered.org

© BAY AREA WILDERNESS TRAINING

This activity can be a terrific teambuilder for families whose children share a class or a grade level, or for an entire school community. Enjoy the sights and sounds of nighttime in your neighborhood and use this activity as a spring board for school camping trips to regional parks in your area!

MATERIALS

- Tents, sleeping bags, sleeping pads and flashlights are the most essential items. Some families in the school community might be able to provide their own gear. Others may not have tents, sleeping bags and other equipment. Camping gear can be borrowed from gear libraries in a small but growing number of cities around the country (see: www.outdoorsempowered.org) and many outdoor gear shops have rental programs.
- It's very helpful to have somewhere to cook outside in the schoolyard, and if possible, a place to gather around a camp fire. If you have an existing outdoor oven in the school garden, that's a wonderful place to cook and share a meal. If not, other options include a portable steel "fire pit," portable camping stoves or BBQ grills (which encourage parents to get involved). Be sure to obtain proper permission from your school district to cook outside during your campout. Invite the local fire department to join you if you need help setting up and managing a temporary fire pit.
- Food to share for dinner and breakfast (e.g. potluck)

DIRECTIONS

- Pick a date: fall or spring is best. You may want to start with a spring event and move it to the fall once you've built a tradition people are looking forward to!
- Obtain permission from the school district for staff, students and their families to be onsite overnight. Because your campout is at school, you probably won't need the same "field trip" form that you use to leave the site.

- Advertise your event. Notify families about the campout as far in advance as possible to build excitement. Send multiple announcements and encourage attendance by announcing a BBQ dinner and s'mores.
- Ask for RSVPs that include whether families have their own gear. Arrange to borrow and pick up the camping equipment for families in your school community that don't have tents, sleeping bags, etc. If you live in a city that has an Outdoors Empowered Network member organization, inquire about the camping training sessions they offer and gear library access, since their gear can be borrowed for FREE. Some local outdoor specialty stores may also be willing to rent/loan gear. GearCommons.com also loans tents through a peer-to-peer gear sharing program.
- Recruit volunteers who can arrive early on the day of the event to help set up the camp site and assist families with their tents. Serve dinner after the group is settled. After dinner, roast marshmallows and make s'mores if you can, since this is an activity that is guaranteed to be popular. Let the kids play with their flashlights and get their teeth brushed, then make time for storytelling around the fire, as this is a great way to settle the kids down. Stargazing might be possible, and is a terrific tie-in to science curriculum. After kids are off to bed, parents can spend more time getting to know one another in an informal setting.
- In the morning, serve breakfast and include everyone in clean up activities. Be sure to leave time for taking down the tents. Wet tents will need to dry before being stored.

Health

Green schoolyards foster children’s social, physical and intellectual well-being and health by providing settings for curiosity, collaboration, imagination, exploration, wonder and adventure.

OBESITY PREVENTION Living schoolyard environments offer child-driven, play-based solutions to the obesity epidemic. They also provide space for students to be physically active during PE classes and while participating in sports and other organized games.

HEALTHIER LIFESTYLES Green schoolyards promote healthier lifestyles through increased physical activity and nutrition-oriented gardening and cooking programs. They are places to learn new skills that foster lifelong health, from balance and physical coordination to water safety and tool use.

IMPROVED WELL-BEING Studies have shown that many types of green spaces have therapeutic properties that lower blood pressure, help people relax and provide other benefits that improve the well-being of children, teachers, school administrators and visitors. Access to nature on school grounds is important for everyone’s health, but can be particularly useful for children with special needs.

ACTIVITIES IN THIS CHAPTER

- *Jump Rope Activities* 23
Active play (5-18 years old)
- *Plant Part Relay Race* 24
Active game (8-10 years old)
- *The Tree is Like Me!* 25
Plant and human physiology / art (5-10 years old)
- *Why Eat Colorful Rainbow Food?* 26
Nutrition and sharing food (4-12 years old)

OTHER RELATED ACTIVITIES

- *“Everybody’s It” Tag* 16
Cooperation game (5-11 years old)
- *Jump the River* 17
Coordination game (5-11 years old)

JUMP ROPE ACTIVITIES

AGES

5-18 years old

CONTRIBUTED BY

American Heart Association
Los Angeles, California
www.heart.org

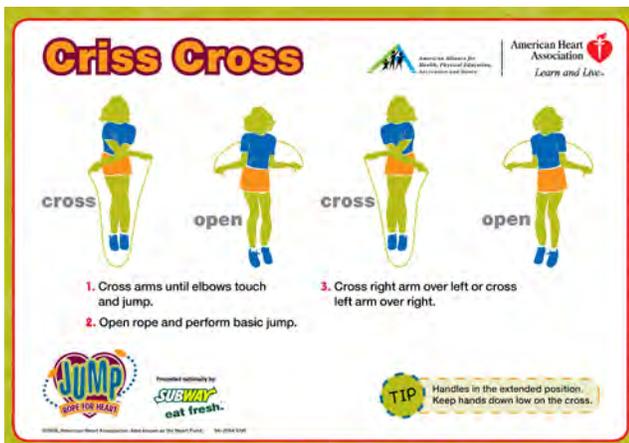

© AMERICAN HEART ASSOCIATION

The American Heart Association is working to help kids, families and communities live heart-healthy lives. Use this physical activity information to help students get active and stay active, for life.

MATERIALS

- Jump ropes
- Jump rope skill cards from *Jump Rope for Heart* (See: www.heart.org/idc/groups/heart-public/@wcm/@fdr/documents/downloadable/ucm_468961.pdf)

BACKGROUND

- For both children and adults, increased physical activity is associated with an increased life expectancy and decreased risk of cardiovascular disease. Physical activity produces overall physical, psychological and social benefits.
- Inactive children are likely to become inactive adults. Physical activity helps with controlling weight, reducing blood pressure, raising HDL (“good”) cholesterol, reducing the risk of diabetes and some kinds of cancer, and improved psychological well-being, including gaining more self-confidence and higher self-esteem. Physical activity should be increased by reducing sedentary time. It should be fun for children and adolescents. Parents should try to be role models for active lifestyles and provide children with opportunities for increased physical activity.

DIRECTIONS

- Included (left) are two jump rope activities for school children sourced from the American Heart Association’s *Jump Rope for Heart*. Follow the directions on the cards to teach children a variety of jump roping patterns and games. This is a time when children can establish the foundation for movement skills. These are also the years when positive experiences can establish a positive attitude and appreciation for participating in daily physical activity for life.
- *Jump Rope for Heart* promotes the value of physical activity to elementary school children while showing them they can contribute to their community’s welfare.

PLANT PART RELAY

AGES

8-10 years old

CONTRIBUTED BY

Community Alliance with Family Farmers

Davis, California

www.caff.org

© ERIN DERDEN-LITTLE

In this activity, students connect the foods they eat to the six parts of a plant while being physically active. It requires an open space with even ground for kids to run and can be adapted for a 15-25 minute time slot.

MATERIALS

- At least 50 cards printed with different types of produce
- One sign for each plant part: root, stem, leaf, flower, fruit, seed
- Six containers
- Diagram showing all six parts of a plant

BACKGROUND

- Plants have six primary plant parts: roots, stems, leaves, flowers, fruits and seeds. The produce items we eat can be classified by plant part – for example, carrots are roots, spinach is a leaf, zucchini is a fruit and a broccoli crown is made up of flower buds.

DIRECTIONS

- The class will be divided into two to three teams, depending on the number of students. To set up the race, divide the cards evenly among the teams and place them at each team's starting line. Attach each plant part sign to a container and set them a good distance from the starting line.
- Ask students to sit in a circle so they can all see the teacher. Display a diagram of a plant showing the six plant parts. Ask students to explain what each plant part does or why it is important. The discussion should include the following ideas:
 - **ROOTS:** Bring in water and nutrients from the soil and hold the plant firmly in the ground.
 - **STEMS:** Act as an elevator for the nutrients/water and bring them to the rest of the plant (like our veins). Provide structure for the plant (like our skeleton).

- **LEAVES:** Gather sunlight for photosynthesis in order to create food for the plant.
- **FLOWERS:** Contain the reproductive parts of the plant. Fruits and seeds are produced after flowers are fertilized through pollination. Some flowers rely on insects, animals, wind or water for pollination. Bees are the pollinating insects we hear about the most. We wouldn't have many of the fruits we eat without the help of bees!
- **FRUITS:** Develop from fertilized flowers. Fruits are the outer covering that protect the seeds. They are sometimes fleshy, (apples, tomatoes) sometimes dry or hard (walnut shell).
- **SEEDS:** Contain the embryo for a new plant and a food supply that the embryo uses to sprout.
- Explain that the students' job is to think about which plant part we are eating when we eat a particular type of produce. For the relay race, they will sort cards displaying things we eat into the correct plant part category. Show the group a few examples to practice.
- Divide the students into teams, line them up and go over the rules. The first person picks up a card and works with his/her team to decide which plant part it is. The person with the card skips or hops to the corresponding container, drops the card in the container, then skips or hops back to tag the next person in line. Keep playing until the cards run out.
- Encourage the children to work with their teammates! Once finished, ask the students which cards were the hardest to sort. While they watch, go through a few cards in each container and discuss whether each item fits or whether it should be placed under a different plant part category.

THE TREE IS LIKE ME!

AGES

5-10 years old

CONTRIBUTED BY

TreePeople
Beverly Hills, California
www.treepeople.org

© SHARON DANKS

Comparing ourselves to trees might appear silly but, if we take a look we find that we are quite similar. Bodies correlate to trunks, blood to sap, arms to branches; we begin to see a resemblance. What about our needs? Water to drink, air to breathe, food to eat; recognizing these similarities help us tune in to the natural world in a unique way. We will be able to see that “the tree is like me!”

MATERIALS

- Butcher paper or other mural size paper
- Crayons or markers
- Fallen tree leaves

© TREEPEOPLE

DIRECTIONS

- Take students out to see a tree and ask, “What would it be like to be a tree?”
- While laying underneath the tree, instruct the students to close their eyes. Lead them through a visualization that has them imagining their toes reaching down into the warm soil to become roots... their arms reaching up toward the sun to become branches... their hair and finger tips sprouting leaves... and their body strong and straight and covered with bark. Continue the visualization to imagine water soaking up through their roots; carbon dioxide coming into their leaves and releasing oxygen; birds landing on their branches; spreading their branches to create shade; and more.
- Ask students to open their eyes and share experiences.
- Next, have students lie down on a sheet of mural paper in the classroom or outside. Trace around their bodies, creating individual life-size images. Ask students to add their face to the drawing and then to make the rest of their body look like a tree: body=trunk, hands/arms=branches, skin=bark, hair/fingers=leaves, feet/toes=roots.
- Invite students to draw animals on their Tree/Me image and glue fallen leaves on their branches.
- Ask students, “What are the similarities between our bodies and the structure of a tree?” “What else do you think people have in common with trees?” (e.g. blood is like sap; similar needs for food, water, air, etc.)

WHY EAT COLORFUL RAINBOW FOOD?

AGES

4-12 years old

CONTRIBUTED BY

Trinity Gardens
Santa Barbara, California
www.trinitygardenssb.org

© JUDY SIMS

Children learn about the nutritional benefits and tastes of colorful, fresh produce snack food through this activity. Together they build a food rainbow from fresh produce. They then taste a prepared rainbow food snack at a community table. The group may also be involved in planning, planting and harvesting from a rainbow shaped children’s garden.

MATERIALS

- Large basket of colorful, whole produce; one per child
- Additional fresh produce, cut up for each child’s finger food rainbow snack (Optional: hummus for dipping)
- Laminated food rainbow color word cards, in English and other languages, as desired
- California Dept. of Education’s laminated food cards (or assorted seed packets, magazine or calendar pictures)
- Compostable paper plates, cups and napkins
- Hand washing station
- Painter’s canvas tarp or old sheet, with colored bands each 10-12 inches wide, to create a “food rainbow”

DIRECTIONS

PART I. Rainbow Mat Activities (about 20 minutes)

- Ask students to sit around three sides of a rainbow painted floor mat; position teacher on the fourth side
- Discuss: “Why eat a FOOD rainbow?” Use charts, books and/or a song to introduce and reinforce that each food color helps our bodies grow in special ways.
- Students echo: “Red helps my heart,” “Orange helps my vision,” “Yellow helps my skin,” “White supports my good health (immune system),” “Green gives me stronger bones and teeth.” “Blue and purple help my brain to remember (memory).” (Note: see additional information online about the health benefits of vegetables and fruits.)

- Distribute whole produce to each student. Invite those holding red vegetables or fruits to place them on the rainbow mat near the matching color word. Help students identify each type of produce and discuss how each color helps our bodies. Repeat for each color.
- Review and summarize: “What have we learned about the importance of eating different colors of fresh food?”

PART II. Eating the Food Rainbow (20-30 minutes)

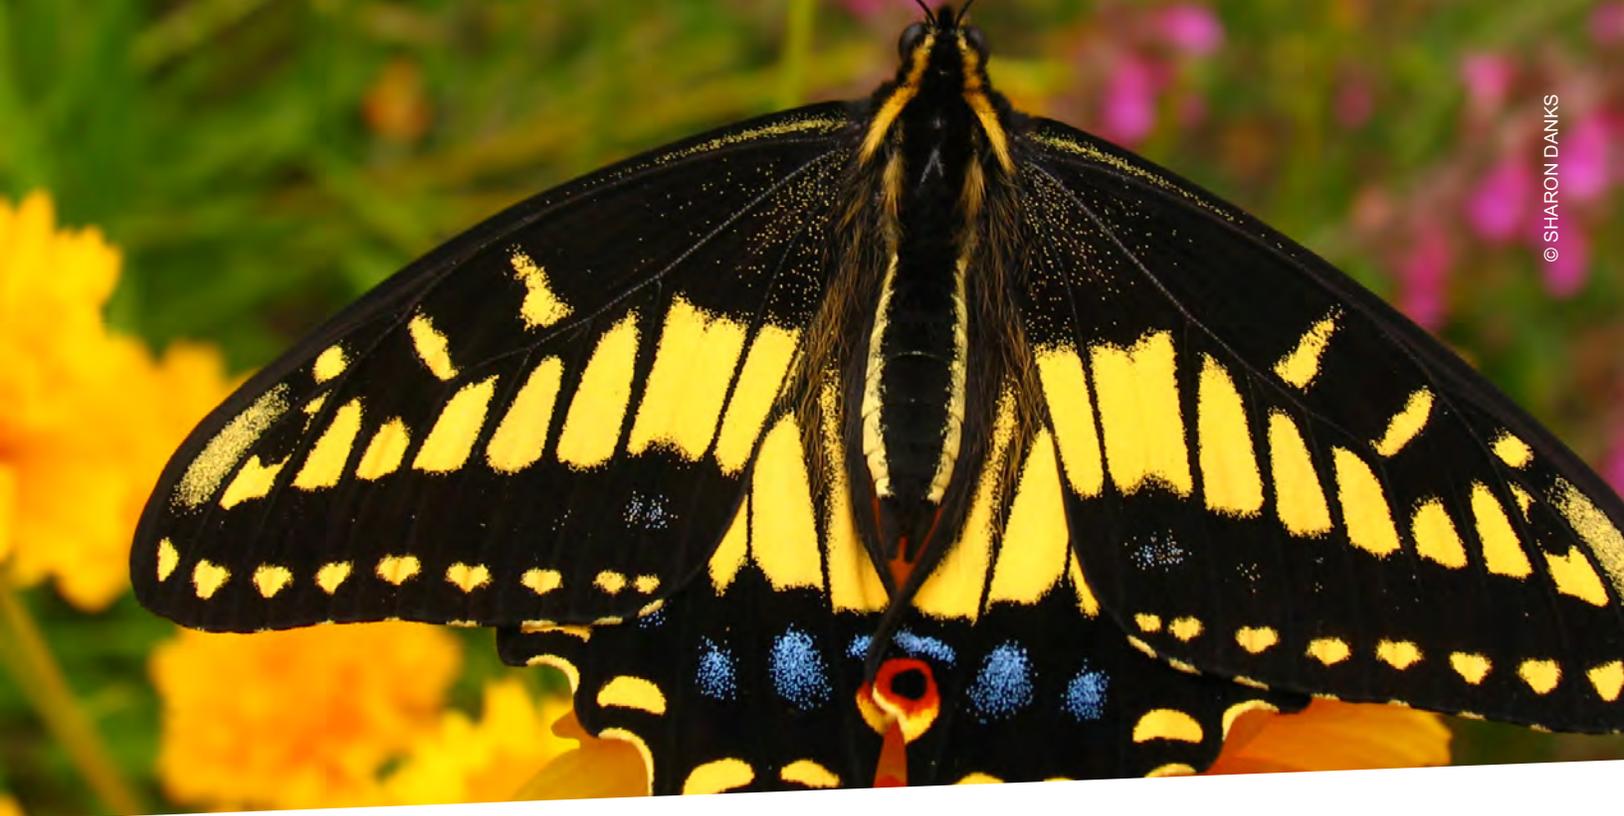

- Ask students to wash their hands, set the table and sit down to have a snack using the cut produce.
- As they try each type of food, review healthy food concepts and discuss flavors. Encourage students to try foods for the first time. The teacher models by eating each item.
- Compost leftover food and paper. Write in journals about food tasting experiences.
- Contact Trinity Gardens for free seeds to plant a rainbow garden as a follow up project.

OPTIONAL RESOURCES

Books (ages 4-8): *I Can Eat a Rainbow* (Annabel Karmel); *Growing Colors* (Bruce McMillan); *Eating the Alphabet* (Lois Ehlert)

Books (ages 8-12): *Blue Potatoes, Orange Tomatoes* (Rosalind Creasy), *The Vegetables We Eat* (Gail Gibbons)

Wildlife Habitat

Schoolyard wildlife zones are important and engaging places that help students of all ages connect to the natural world. They illustrate that “the environment” is not just the rainforest in a far away place—it is something that surrounds us all in our local neighborhoods. Wildlife sanctuaries, large or small, enrich their school’s curricula while providing refuge for a variety of species. They allow students to see that wildlife can exist in urban and suburban areas and even thrive with a little help. Wildlife areas can be connected to the curriculum in countless ways, including nature observation in science classes, sketching practice in art classes, and population estimates/counts for math classes.

The strongest projects provide well-rounded habitats that fulfill the basic needs of wildlife—consistent food sources, clean water, shelter and areas where they can rear their offspring. Successful schoolyard wildlife sanctuaries also provide places for students to observe birds, animals and insects while leaving the creatures relatively undisturbed. They are peaceful havens for quiet reflection where flora and fauna are nurtured, changes happen slowly following ecological cycles and planting schemes highlight seasonal change and mimic natural patterns. (Danks, 2010)

ACTIVITIES IN THIS CHAPTER

- *Schoolyard Investigations Using Tools* 28
Science and math lesson (4-8 years old)
- *Blue Whale: An Animal of Unusual Size* 29

Scientific lesson / place-based study (9-18 years old)

SCHOOLYARD INVESTIGATIONS USING TOOLS

AGES

4-8 years old

CONTRIBUTED BY

Monterey Bay Aquarium

Monterey, California

www.montereybayaquarium.org

© JOEY LEHNHARD

Young children can use observation and measurement to find out more about an environment using simple tools that extend human senses and make the data collected more precise and scientific. In this activity, students take a closer look at a small part of their schoolyard and use scientific tools to observe and explore what they see!

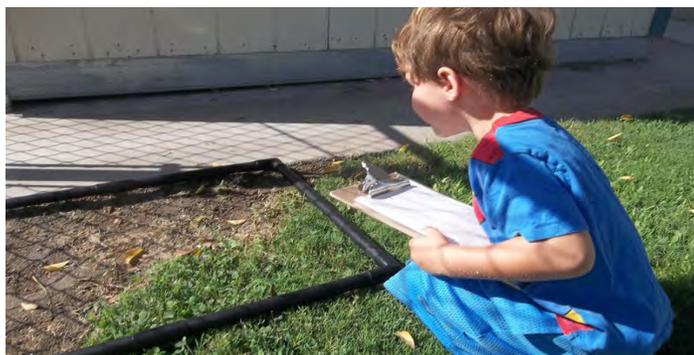

MATERIALS

- Magnifier, thermometer, 1m-long piece of string
- Science notebook, pencil, clear tape

DIRECTIONS

- Select an area of your schoolyard that has both sunny and shady areas. Explain to students that today they are going to do what scientists do—collect data—about their schoolyard. Show them the place in their science notebooks where they will record their findings.
- Tell students to:
 - Make a string circle, lay it on the ground and observe what you find inside of it.
 - Collect a soil sample from your circle and tape it into your notebook.
 - Use the thermometer to take the surface temperature inside your circle.
 - Count the number of insects you find in your circle.

- After students spend time collecting data, return to the classroom and graph and analyze or discuss what they found. Record students' questions on a chart or Question Wall for further investigation. Help them think about their data by asking the following questions:
 - Look at your soil samples. What do you see? Now look again with the magnifier. How are the two samples the same? How are they different? Could you find some soil that looks different from your samples? Where would you look?
 - Which area was warmer, sun or shade? Do you think we could find the very WARMEST place in our schoolyard? Where would you look? Do you think the temperature stays the same in those areas all day? How can we find out?
 - How many insects did you find? Where could you look for more? Do you think you would find the same number if you went back another day? How can we find out? Can you find a place with more insects in the schoolyard? Where might you find more insects, in the sun or in the shade?
 - What did you find in the sun that you didn't find in the shade? What did you find in the shade that you didn't find in the sun?
 - What interesting thing did you find? Was it in the sun or shade? What makes it interesting to you? Can you describe it?
- Scientists must look more than once at their study areas to begin to answer questions. Ideally, take the children out again to answer these and other questions.

BLUE WHALE: AN ANIMAL OF UNUSUAL SIZE

AGES

5-11 years old (and high school geometry/trigonometry)

CONTRIBUTED BY

California Coastal Commission
San Francisco, California
www.coastforyou.org

© CALIFORNIA COASTAL COMMISSION

Blue whales are the largest animals known to have lived on earth, and they can be seen right off the coast of California! Could a blue whale fit in your schoolyard? Compare the height of a tree in your schoolyard to the length of a blue whale.

MATERIALS

- A yard stick and a 100 foot rope or measuring tape
- Clinometer made with a protractor, a straw, string, paper clip or metal washer

DIRECTIONS

- How can you tell if a blue whale could fit in your schoolyard? Start by asking students what they know about blue whales. There are many options for learning about these whales, and you can have students do research ahead of time or share information from the resource links included at the end of this activity.
- Come prepared with a piece of rope that has been pre-measured to 100 feet (or 30 meters), or a long measuring tape. Have two students each take one end of the rope and walk slowly apart until the rope is taut, then place it on the ground. Explain that a blue whale can grow to this size. Have students line up along the rope with their arms outstretched, fingertips just touching. Are they as big as the whale? Have students close their eyes and imagine an animal as big as a blue whale, swimming next to them. What do they think it is like to be a creature that size?
- Older students can compare the length of a blue whale to the height of the tallest tree on their school grounds (or to a flag pole, their school building, or other tall feature). How tall do the students think the tree is? One method to calculate the height is to compare shadows on a sunny day. Use measuring tape to measure the shadow cast by the tree. Next measure a shadow cast by a yard stick (or meter stick) held perpendicular to the ground. The shadows will be proportional to the original objects.

USE RATIOS TO CALCULATE TREE HEIGHT

(Shadow of measuring stick) / (Shadow tree) =
(Length of measuring stick) / (Height of tree)

→

Height of tree =

(Length of measuring stick)*(Shadow of tree) / (Shadow of stick)

- Another method to calculate height is to use a clinometer. Tape a straw or a small roll of paper to the flat side of a protractor. Thread some string through the hole in the protractor (near the center of the straw), and tie a weight (a paperclip or a washer) to the string so it stretches past the bottom of the protractor and swings freely. Have one student look through the straw to see the top of the tree. Have the student move farther from or closer to the tree until a partner tells them that the string is hanging down at a 45 degree angle on the protractor. The student has now formed an isosceles right triangle with the tree (see diagram above). The distance from the student to the tree, plus the student's height, equals the height of the tree. Is the tree taller than a blue whale is long? Imagine a blue whale next to the tree. How many trees would it take to equal the length of the blue whale? Why might it be useful to measure a tree this way?

BUTTERFLY HABITAT HUNT

AGES

5-12 years old

CONTRIBUTED BY

National Wildlife Federation, Schoolyard Habitats®
Midpines, California
www.nwfcalfornia.org

© ELIZABETH SOPER

Students will explore what butterflies need in order to survive and will investigate their own school grounds for butterfly habitat.

MATERIALS

- Pictures of local butterflies
- Research/articles on butterfly habitat and host plants for your geographic area
- Magnifying glasses
- Nature journals

DIRECTIONS

- Explore the concept of wildlife habitat with your students. Ask them what they think wildlife need in order to survive.
- In order for an animal to survive, it must be able to find adequate habitat that provides food, water, cover and a safe place to raise young. The amount and quality of these needs varies a great deal from species to species.
- Now have students think specifically about butterflies. Where do they tend to see butterflies? What do they think butterflies eat? Where do they think butterflies find cover and raise their young?

© SHARON DANKS

- Many butterflies require specific plants in order to survive. These plants are called “Host Plants.” For example, Monarch butterflies require milkweed in order to survive. Ask students to research which butterflies are present in their local community and which habitat and host plants they may require.
- Next, take your students outside to your own schoolyard and have them explore the grounds for butterflies and plants. Younger students can draw what they see in their journals or you can also cut out squares of construction paper of different colors. Hand out one or more (depending on level of students) squares of several different colors and have them look for butterflies or flowers that include that color. Ask students to observe these animals/plants carefully and draw them in their journals. For older students, take them outside for a butterfly/plant hunt. As a group, search for the butterflies and plants they identified in their research.
- Alternatively, divide students into groups and ask each group to look for one specific type of butterfly or plant. Depending on the time of year, students can also look for butterflies and draw what they see in a nature journal or on a sheet of paper.
- When you return to the classroom, examine your results. Make a list (or simple sketches) of the plants and/or butterflies you found. Could you add any plants to make the schoolyard a better place for butterflies?

Consider planting or starting a butterfly garden as part of a Schoolyard Habitats® site. Visit our website for more information: www.nwf.org/schoolyardhabitats

SCHOOLYARD HABITAT SURVEY

AGES

5-10 years old

CONTRIBUTED BY

CalRecycle
Sacramento, California
www.CaliforniaEEI.org

© SHARON DANKS

Students conduct a survey of their schoolyard to determine in what ways it is a habitat for plants and animals. They work in small groups to discuss and sketch their ideas on how to improve their schoolyard for plants and animals.

MATERIALS

- Piece of paper (and clipboards if feasible) for students to record their findings (written words or drawings) while they are outside studying schoolyard habitats.

DIRECTIONS

- Put students in pairs. Assign each pair an adult helper/older student buddy, if available.
- Explain to students that they are going out to the schoolyard to see which plants and animals they can find. They will use their paper to draw and write about some of the plants and animals they see and will note where they found them.
- Lead them outside, talk about appropriate physical boundaries and the importance of not disturbing what they see (nests, flowers, etc.). Give them 15 minutes to walk around the schoolyard recording what they find.
- Return to the classroom for a group discussion about the findings. Teachers may help the class organize and summarize their findings in columns, e.g. “What We Found” (animal or plant) and “Where We Found Them”.
- Finish the activity by having students write and draw about how people can help plants and animals survive in their habitats. Doing so will help teachers assess students’ understanding. (e.g. We can plant trees to make a habitat for birds.)

GARDEN-BASED LEARNING LESSON: INTERDEPENDENCE

AGES

7-10 years old

CONTRIBUTED BY

Berkeley Public School Gardening & Cooking Program
Berkeley, California
www.berkeleyschools.net/cgp

© BERKELEY PUBLIC SCHOOL GARDENING & COOKING PROGRAM

Students explore different environments within the school garden to identify various ways flora and fauna adapt to natural and non-natural environments. After this lesson, students will understand how plants and animals survive in their habitats and will have an emerging understanding of biodiversity and its importance in gardens of all types.

MATERIALS

- Garden journals and pencils
- Assorted garden tools
- Scavenger hunt cards that picture flora and fauna found in your school garden (make these ahead of time with your class)

DIRECTIONS

- Bring the class outside into your school garden.
- Distribute garden journals and scavenger hunt cards to teams of two. Discuss how plants have particular features that enable them to conserve water and absorb sunlight.
- Instruct students to find a plant to describe that: has tiny leaves, a spine, uses stems to climb, is covered in tiny hairs or has giant leaves. Have them find an animal or insect that: burrows under ground, sunbathes, eats garbage or walks on two feet. Students document these findings in pairs as they explore the garden using their scavenger hunt cards.
- Regroup students and discuss adaptation behaviors and physical features that help living things survive in their habitat. Students then share their observations and discuss how these characteristics could have adapted over time to fit their environment.
- Ask students to discuss with their partner their knowledge of what plants and animals need to survive (nutrients, sunlight, water, shelter). Next, encourage the partner pairs to share their discussion with the group. Students can describe what they found during the scavenger hunt and share something about how it has adapted to its environment.
- To provide ceremony to the closing of the lesson, offer students a seasonal snack or invite them to forage and taste something in the garden on their way out. Ask students to think about how that piece of fruit or vegetable has adapted to survive in its environment.

STEAL THE NATIVE PLANT

AGES

8 years old and up

CONTRIBUTED BY

Center for Land-Based Learning
Winters, California
www.LandBasedLearning.org

© MATT LECHMAIER

This game is modeled loosely after “steal the bacon”. Teams of students learn to identify native plants and then compete with other teams to be the first to tag the correct plant when called. This game promotes teambuilding, helps students hone their plant identification skills, and encourages students to run.

MATERIALS

- 3-7 different native plants (either growing in pots, or cuttings you’ve taken from mature plants)
- Plant identification cards or field guides with information about the native plants (one set for each team)
- A large, flat area, safe for running

DIRECTIONS

- Create 2 to 6 teams with equal numbers of players, up to 6 in each team. Give each team time to learn all the plants by looking carefully at each one, describing its unique characteristics using the field guides.
- Assign each person in each team a number from 1- 6, depending on the size of the teams. If you do not have the same number of people in each team, you can give one person two numbers. (For example, if you have three teams of 6 and one team of 5, you can give one of the people in the team of 5 two numbers to be responsible for.) Each team should have a number 1 person, a number 2 person, etc.
- Arrange all of the players into two lines, opposite each other, and declare these to be the starting lines. Place 1 plant of each species on the center line, between the players.
- Call out the name of a plant and then a number. If you called out Toyon #2, for example, the #2’s from each

team would run to the centerline and try to be the first student to touch the Toyon. Calling the name of the plant first, before calling out the number of who will go touch the plant, makes all the students think about which plant that is, instead of just the students whose number you called. The person who touches the plant first, wins a point for their team. You can play until a team reaches a specified number of points, or until all the plants and numbers have been called.

- Remind players that they must be aware not to harm the plants or each other. Be aware that students will be running toward each other from multiple directions and possibly looking down at a plant instead of up at each other.
- You can choose to place multiple plants of the same species in the center to allow multiple students to find the correct plant. You can also call out a unique characteristic of a plant instead of the plant’s name.

PLANT A NATIVE HEDGEROW

AGES

8 years old and up

CONTRIBUTED BY

Collaborative for High Performance Schools (CHPS)
Sacramento, California
www.chps.net

© SHARON DANKS

A hedgerow is a linear arrangement of closely spaced shrubs and trees designed to create a fence-like border, serve as a barrier or mark a boundary. In a schoolyard context, a hedgerow can also act as a windbreak, create shade and promote habitat for beneficial insects and birds. Plants in hedgerows can be chosen for a variety of services that support a nearby school garden, such as: masking crop plants from pests, deterring pests with their scent, enticing pests away from crops, and serving as nurse plants and food sources for beneficial insects that assist in the management of organic gardens.

MATERIALS

- Mixture of native hedge plants (mostly perennial shrubs)
- Well-rotted manure or peat-free compost
- Cardboard
- Shovels, trowels, spades and/or forks
- Gloves
- Bark, mulch, straw or grass clippings
- Pruning shears
- Stakes or bamboo sticks

DIRECTIONS

- Decide where the hedge is to be planted. Consider linear spaces around the perimeter of a school garden or other school ground boundary between adjacent uses.
- Source native hedgerow plants from your local nursery.
- Mark planting locations 12 inches apart in the designated row using stakes or bamboo sticks. Double rows may be needed, or even triple rows, if your site is very exposed to the wind or if you would like to create a dense boundary. If you are planting more than one row, stagger the plants as in this diagram:

X X X X X X X X X X X X X X X
X X X X X X X X X X X X X X X

- Dig holes approximately the same depth as the height of your plants' root balls, or as directed by your local nursery. Add a trowel full of compost or manure to each

hole and mix with the native soil. Loosen the root ball of each plant slightly (so roots will not continue to grow in a circle in the ground) and place one plant into each hole. Fill the remainder of each hole with native soil and firm the soil around the plant to remove any air spaces. Water the new plants. Add a 1-foot wide strip of cardboard to the soil's surface around the plants to deter weeds. Cover the cardboard with a thick layer of bark, mulch, grass clippings or straw.

- Clip plants to 12 inches high to encourage root development and new growth but leave a plant unclipped roughly every 10-12 feet to become a standard.

OBJECT MATCH CHALLENGE

AGES

9-18 years old

CONTRIBUTED BY

California Native Plant Society
Sacramento, California
www.cnps.org

© SAN FRANCISCO UNIFIED SCHOOL DISTRICT

This is a great, hands-on, introductory activity for biology classes that can be done with students in a schoolyard. The goal of this exercise is to help students learn to provide sustained, focused attention on the details of a plant (or object) they choose, and to learn to describe and record what they see, in detail. This activity is a natural fit for lessons about herbivore predation, adaptations, photosynthesis, diversity, cells, respiration and other biological topics.

MATERIALS

- Hard writing surface for each student (e.g. clipboard)
- Piece of paper and a pencil (or colored pencils) for each student
- Plant materials and other natural objects found in the schoolyard or local neighborhood. Fallen leaves work best, but a single leaf taken from a plant is also a good subject for study.

DIRECTIONS

- Set the challenge for the students. Give them a few minutes to find a natural object in the schoolyard to study during this exercise. (A biological focus.) Once they find their object, they will draw it using the entire sheet of paper. Their drawings should be:

A= Accurate

B= Big

C= Clear

D= Detailed

E= Explained

These standards will set the tone for the students and allow their work to be compared to others in the class during a “match up” challenge at the end of the lesson.

- Ask students to take their time and capture as much detail from their objects as possible.

- As the students are working, the teacher should review their progress and encourage them to add more detail, explanations, colors, dimensions and other subtleties of their object. This will help them to meet the “Explained” portion of the standard.
- When the students have finished their drawings in an allotted amount of time (20-30 minutes), gather the group back together in a central location.
- Have the students place their papers in a circle on the ground, or on the perimeter of a table. Ask them to put their objects in the middle of the circle, but not near their own drawing.
- Once all of the students have added their papers and objects to the circle, ask the entire class to work together to match each object with the corresponding drawing.
- Debrief the class about which objects were the easiest to identify and match, and which ones were more difficult. What clues helped the students match their objects?
- Use the drawing standard to guide the discussion. Ask broad questions to bring out their curiosity about the focus topic. The discussion may also continue in the classroom.

Adapted by San Francisco Unified School District from: California Native Plant Society, *Opening the World Through Nature Journaling*, Version 2.1, John Muir Laws. Used with permission.

DOCUMENTING BIODIVERSITY IN YOUR SCHOOLYARD

AGES

9-18 years old

CONTRIBUTED BY

California Academy of Sciences
San Francisco, California
www.calacademy.org/educators

© KAIT SHORROCK

Using simple tools and technology, develop and carry out an original scientific investigation about biodiversity on your school campus. Use iNaturalist to conduct a biological survey, get help with species identification and connect with a global network of naturalists. Then, analyze your data, draw conclusions and share your findings to inspire environmental stewardship in your community.

MATERIALS

- Mobile device with iNaturalist app downloaded (1 per group of 2-5 students)
- Science notebook (1 per student)

PREPARATION

- Review the iNaturalist mobile app and website: www.inaturalist.org/pages/teacher's+guide
- Setup login: www.inaturalist.org/pages/getting+started
- Select your schoolyard study site as your “place”

DIRECTIONS

- Lead a short discussion accessing prior knowledge about schoolyard biodiversity. Ask the students: Which species (large or small) have you seen on your school grounds?
- Show students the iNaturalist website and app and, if applicable, show any data that already exist near your schoolyard. Ask students: Which of these species are unfamiliar to you? Who collected these data?
- Explain that today students will be collecting data using iNaturalist to document the species they can find in their schoolyard.
- Ask students to log onto iNaturalist on the mobile devices. Model how to take a photo of an individual organism and sync to iNaturalist. Give students time to practice.
- Have students create a preliminary inventory by using a mobile device to take photos of individual organisms.

Divide responsibilities so that everyone has a chance to take photos, sync to iNaturalist, identify species and complete online entries. (Use the online tutorials to practice this process before teaching the students.)

- Facilitate a discussion about what the students observed. Ask: What kinds of organisms did you observe? What did you see that you didn't expect?
- After students have a sense of local biodiversity, have them work in small groups to examine the data, compare their schoolyard to a nature preserve and discuss.
- Then ask students to answer questions in their science notebooks: What kinds of organisms are abundant near your school? What is rare? Why do you think that is? How did the organisms near your school get to be there? What do they need to survive? Does anything seem strange, confusing or interesting to you about what lives in your environment? Record all questions in science notebooks.

RECOMMENDED EXTENSION

- Continue students' background research on local environmental issues by investigating local news and interviewing community members. Have students develop their own research questions, gather more data on the schoolyard, analyze results and share them with their community.
- More information is available from: www.alpha.projectmash.org/experience/explore-explain-and-sustain-life

Watershed Stewardship

Clean, fresh water is a precious resource. It comes to our schools and communities in the form of rainfall and through municipal plumbing systems and natural waterways. It leaves school grounds through man-made stormdrains, sewer networks and by flowing over the landscape and percolating into the soil. In most cases, water from these sources is relatively clean when it arrives on school grounds and dirtier when it leaves. School communities have the power to improve their local water systems and to use them as educational resources at the same time by incorporating water planning into the design and use of school grounds. (Danks, 2010)

WATER CONSERVATION Living schoolyards can conserve water by incorporating drought tolerant species that do not need frequent irrigation, by building gardens with efficient drip or subsurface irrigation and by deeply mulching planted areas.

STORMWATER MANAGEMENT Schoolyards designed to manage stormwater can be beautiful and educational while holding and utilizing rainwater, and purifying urban runoff.

GREYWATER REUSE Schools can capture lightly used water, purify it and then use it to water trees onsite, reducing the amount of fresh water they need from the municipal system.

ACTIVITIES IN THIS CHAPTER

- *Follow the Water: Make a Stormwater Map* 38
Science lesson (7-11 years old)
- *Sheet Mulching: Turn Lawns into Native Gardens to Save Water* 39
Horticulture / grounds improvement (9 years old and up)
- *Calculating Rainwater Runoff* 40
Science and math lesson (10 years old and up)

OTHER RELATED ACTIVITIES

- *Create a Schoolyard Site Survey Map* 56
Mapping / place-based study (5-18 years old)

FOLLOW THE WATER: MAKE A STORMWATER MAP

AGES

7-10 years old

CONTRIBUTED BY

The Trust for Public Land
San Francisco, California
www.TPL.org

© JEANINE STRICKLAND

In this activity, we will map where rainwater flows around your schoolyard, observing where it collects and moves faster and where it slows down and soaks into the ground. We will also learn about where stormwater goes after leaving the school.

MATERIALS

- Schoolyard plan (map) or aerial photo
- Map of your neighborhood
- Pens and/or pencils

DIRECTIONS

- If you were outside during a rainstorm recently, did you notice water flowing across the pavement? You may be familiar with the term “watershed”; it is the land area from which surface runoff drains into a stream, channel, lake, reservoir or other water body. The next time it rains, watch the stormwater’s behavior as it hits the ground at your school and flows downhill. How does it flow over different types of materials? Where does the water go? What else do you observe? Make a schoolyard stormwater map with your class to find out.
- Landscaped areas with plants, grass, sand, gravel or mulch hold water like a sponge. These are “pervious” or “permeable” materials. Mark them on your map.
- Hard surfaces such as paving and buildings do not absorb water. During your rainy day observations, you may see large amounts of water collect in the gutters, pour from the downspouts and flow toward the storm drains. Mark these “impervious” surfaces on your schoolyard map.
- Roofs drain to gutters which collect water that then flows into downspouts (often at corners of buildings) and onto the school grounds. When it is raining, you may see water gushing out of each downspout. Mark the school building’s “downspouts” with an “X” on the map.
- Follow the streams of water flowing during a storm to find the storm drains and catch basins and mark them on your schoolyard map with a square. These drains lead to a broader network of city storm drains, which may flow directly to a creek, river, lake or other water body.
- Check your neighborhood map to see if you can identify where the water goes after leaving your school site. If that water flows to a stream, can you trace the stream downhill to see which larger water body it joins?
- Mark the puddles and soggy spots on your schoolyard map. Where are the biggest or deepest ones? Which ones evaporate and disappear first? Can you find any “swales” (ditches)? If so, observe how planted swales slow the rainwater and allow it to be filtered and partially absorbed before the remainder flows to the storm drain.
- Can you identify any opportunities at your school to protect water quality by reducing stormwater runoff and/or preventing stormwater pollution? Stormwater pollution occurs when rain or snowmelt flows over streets or paving and picks up trash, oil, dirt and other materials as it travels. These pollutants are then carried to the storm drains and then to local creeks and streams.
- Ask your city if they have a water quality “stenciling” program to mark your local storm drains with an educational message that will help to improve water quality and habitat downstream.

For more information and free outdoor classroom materials, see the East Bay Municipal Utility District’s website: www.ebmud.com/resource-center/for-teachers

SHEET MULCHING: TURNING LAWNS INTO NATIVE GARDENS

AGES

9 years old and up

CONTRIBUTED BY

StopWaste

Alameda County, California

www.stopwaste.org

© STOPWASTE

Many San Francisco Bay Area native plant species are adapted to extended periods of time with little rainfall, due to California's dry summer climate. These drought tolerant plants contrast greatly with the thirsty, non-native lawns that make up much of our built environment, including school grounds. Sheet mulching is an easy, hands-on approach to converting a lawn into a healthy layer of soil ready for planting California native species and creating a diverse schoolyard ecosystem.

MATERIALS

- Biodegradable “sheet” material, such as cardboard
- Mature compost
- Coarse mulch materials (wood chips or tree trimmings)
- 1 bucket per student; access to water
- Gardening gloves and sunglasses to protect hands and eyes from splinters and dust
- 4 inch starts of California native plants, as desired (If you live outside California, use plants that are native to your own region.)

BACKGROUND

- Sheet mulching uses cardboard to block the sun, enabling grass and weeds to decompose and adds nutrients to the soil, accelerated by the water. A layer of compost creates

a welcoming environment for plants to go directly on top of the cardboard. A top dressing of mulch protects the soil and helps retain moisture, reducing the need for water.

DIRECTIONS

- Identify and measure the space (lawn or bare soil) you want to sheet mulch and make sure you have enough material to create 1 layer of cardboard, a 1 inch layer of compost and a 2 inch layer of mulch. A handy Sheet Mulching calculator can be found at: www.stopwaste.org/preventing-waste/mulch-calculator
- If the space is surrounded by a sidewalk, work with students to dig shallow trenches (8 inches wide x 6 inches deep) along the hardscape perimeter to prevent sheet mulching materials from overflowing onto the sidewalk.
- Sheet mulching is accomplished one step at a time:
 - Lay cardboard directly on top of the lawn (or bare soil), overlapping different pieces by at least 8 inches.
 - Wet the cardboard until it is completely saturated.
 - Add a 1 inch layer of compost on top of wet cardboard.
 - Add a 2 inch layer of mulch on top of compost.
 - Pull back the layer of mulch to plant 4 inch starts directly into the compost, as desired. Carefully place the mulch back around the starts.
 - Protect the new sheet mulched, planted zone from foot traffic until the plants are well established.
 - Enjoy the garden!

CALCULATING RAINWATER RUNOFF

AGES

10 years old and up

CONTRIBUTED BY

Education Outside with
San Francisco Public Utilities Commission
San Francisco, California
www.educationoutside.org with www.sfwater.org

© EDUCATION OUTSIDE

In this activity, students in dry climates determine how many gallons of rainwater fall on a roof linked to their cistern. They also estimate how much water their school uses to irrigate a drought tolerant garden and determine how many cisterns they would need to meet this demand. Students will learn that a lot of water can be captured from roofs for irrigation.

MATERIALS

- Length of string or rope for measuring (50 or 100 ft)
- Measuring tape
- Rainfall chart for your area

BACKGROUND

- The average annual rainfall in California's San Francisco Bay Area is about 20 inches (1.7 feet). This means that if it rains on a hard, impermeable surface like a roof or pavement, and there are no drains to remove the water, there would be 1.7 feet of water covering that area over the course of the rainy season. In many cities, rainwater flows from storm drains to the sewer system and is treated before it is released into the ocean. In non-urban areas, where much of the ground is permeable, rainwater is absorbed, recharges groundwater aquifers or flows into rivers that empty into the ocean.
- Rainwater can be captured and used to irrigate school gardens or to flush toilets at school. Cisterns are large containers that can hold rainwater that flows off a school's roof. Cisterns come in many sizes and may be able to collect enough water to irrigate a school garden during dry periods, reducing tap water use.

DIRECTIONS

- Begin by visiting a cistern in your schoolyard or envisioning where you would like to put one in the future.
- To determine the area of the roof that drains to the cistern, roughly measure the building's length and width (on the ground) using pre-measured lengths of string or using a very long tape measure. Then multiply the length and width to estimate the roof area. $\text{Area} = \text{Length} \times \text{Width}$

- Example: If your building measures 100 ft. long by 30 ft. wide, then: $100 \text{ ft.} \times 30 \text{ ft.} = 3,000 \text{ ft}^2$
- Calculate the volume of runoff generated by rainfall in one year by multiplying the roof area by the annual rainfall.
 - $\text{Area of Roof (ft}^2\text{)} \times \text{Depth of Annual Rainfall (ft.)} = \text{Volume of Water (ft}^3\text{)}$
- Once you have estimated the annual volume of water that falls on the roof, convert cubic feet into gallons by multiplying the volume of water (ft³) by 7.5.
 - $\text{_____ Cubic feet} \times 7.5 = \text{_____ Gallons}$
- Discuss: How many gallons of rainwater fall on your roof annually? Can your cistern hold it all? Where does overflow go? How can you use the water you capture? How many gallons of rainwater does the school garden need? How many cisterns do you need to meet this demand?
 - Determine the area of garden space that needs irrigation
 - Determine the size/capacity of your current cistern
- Gardens planted with natives and drought tolerant plants use less water than most other gardens. To calculate the annual water need, assume a native plant garden needs 1,000 gallons of water per 100 ft² and use this formula:
 - $(\text{Area of Garden} / 100 \text{ ft}^2) \times 1,000 \text{ Gallons} = \text{_____ Gallons Needed Annually for Irrigation}$
- To find out how many cisterns you need to store this much water, divide your school's water need (calculated in the previous step) by the capacity of your cistern.
 - Example: $200,000 \text{ Gallons (annual need)} / 1000 \text{ Gallon Cistern} = 200 \text{ cisterns!}$

Schoolyard Agriculture

In our increasingly urban society, people of all ages have become disconnected from the natural and agricultural environments that sustain us. Starting a school garden is one way to reconnect students and school communities with local agricultural and ecological systems and to create new, vibrant, hands-on learning environments at the same time.

HORTICULTURAL SKILLS Culinary gardens are cost-effective, hands-on learning spaces for studying natural science curricula and horticultural techniques. These are commonly used to teach lessons on topics such as soil, weather, plant growth, insect life cycles and decomposition.

CURRICULUM CONNECTIONS School gardens can also be springboards for topics in many disciplines. They help bring social studies and history lessons to life, and provide engaging settings for teaching arithmetic and geometry, health and nutrition, art and music, reading and foreign languages.

SHARING FOOD Edible gardens give students of all ages insight into where their food comes from, what it takes to produce it and the art of bringing it to the table in an enjoyable manner. Preparing and sharing food in the schoolyard is easier to do if schools build informal outdoor kitchen spaces with ovens or barbeques, sinks and picnic tables. (Danks, 2010)

CIVILIZATIONS OF THE AMERICAS: AZTEC ALEGRÍA RECIPE

AGES

5-11 years old

CONTRIBUTED BY

The Edible Schoolyard
Berkeley, California
www.edibleschoolyard.org

© SHARON DANKS

At the Edible Schoolyard in Berkeley, our students study ancient civilizations of the Americas, combining social studies lessons with related hands-on cooking and gardening projects. The activity below is a cooking project using a grain called amaranth, which was a staple food of the Aztec Empire and was considered sacred. In addition to growing amaranth, the Aztecs followed many of the Mayan agricultural traditions like growing cacao, harvesting honey and growing food on terraced hills. In later years, the Incas further developed terraces using stone walls and rigid geometric patterns. In our curriculum, we explore those agricultural practices and ideas by trying many of them with the students.

BACKGROUND

- Amaranth has been a cultivated grain for thousands of years. The bright flowers can also be used for dyeing cloth and making pigment. When the Spanish conquered the Aztecs and saw how important the grain was for their culture, they banned it.
- Mayans discovered chocolate before the Aztec civilization came about. Chocolate is made from cacao beans. The beans we eat are the seeds within the cacao pod, which grow on trees in the tropics. The cacao plant is native to Mexico. There is bountiful evidence that the Mayan civilization used cacao in their everyday life and valued it highly. We show our students images of Mayan hieroglyphic writing and explain that from writings such as the *Popol Vuh*, we know that the Maya had two main uses of cacao: as currency and as a special drink. The Maya believed the cacao bean had magical and divine properties and they prepared it in the form of a frothy drink that only nobility could consume.
- The Maya were among the world's first beekeepers. They cultivated honey from a native stingless bee that resides within living trees in the tropical forests of Central America. Honey was harvested as part of a religious ceremony twice a year. Honey was used as a sweetener, an antibiotic and as an ingredient in the Mayan version of mead, a fermented drink.

INGREDIENTS FOR AZTEC ALEGRÍA

- 1/3 cup brown rice syrup (or maple syrup or honey)
- 1/2 cup sunflower seeds
- 1 teaspoon ground cinnamon
- 1 cup amaranth, from the school garden or purchased
- 1 tablespoon honey

DIRECTIONS

- Line a sheet pan with parchment paper. Place the jar of brown rice syrup into a pot of hot water. In a deep pan, pop the amaranth in small batches, setting the popped amaranth aside in a mixing bowl.
- Lightly toast the sunflower seeds in a deep pan. Add the toasted sunflower seeds and cinnamon to the popped amaranth.
- Slowly stir in the warmed brown rice syrup and honey. Mix well and pour alegría onto the sheet pan. Spread the alegría mixture evenly over the sheet pan and let it cool. Cut into two inch squares or store it in an airtight container. Eat together in the school garden.

HERB BUNDLES

AGES

5-12 years old

CONTRIBUTED BY

San Francisco Botanical Garden
San Francisco, California
www.sanfranciscobotanicalgarden.org

© SHARON DANKS

Children explore using their senses and create a scented herb bundle to remember their discoveries.

MATERIALS

- For each child: provide a piece of fabric cut into 4 to 5 inch squares and a rubber band
- Activity requires an area containing plants with fragrant leaves which children can collect

© ANNETTE HUDDLE

DIRECTIONS

- Review the five senses. Explain to the children that they will explore the leaves in the area using their senses.
- Discuss: How might we explore this space with our senses? Which sense might we not use today? The sense of taste, unless an adult says we can.
- Take a moment to observe leaf shapes and colors and to notice sounds in the area. Then demonstrate how children can carefully touch the leaves to feel the leaves' textures and then smell their hands to experience each plant's scent.
- Allow children to explore the area for a few minutes, then ask them each to find one plant whose scent they like and stand next to it. Help each child carefully collect two to three leaves from the plant, using one hand to support the stem while carefully pinching off the leaf with the other.
- Gather the children in a circle and distribute the fabric. Have children place their leaves in the center of their square and then wrap the fabric around the leaves, pressing the leaves into the center. Distribute the rubber bands and help children wrap the rubber band to close the bundle.
- Ask the children to offer one word to describe the scent of their bundle. If there is a good variety of plants, have children trade with a partner, smell the bundle and then try to find the plant whose leaves are inside. Remind them that gently squeezing the bundle will help release the scent of the plant even after the leaves have dried.

SEED SAVING WITH CHILDREN

AGES

All Ages

CONTRIBUTED BY

Grow Your Lunch, LLC
San Francisco, California
www.growyourlunch.com

© BENJAMIN EICHORN

Saving seeds preserves genetic diversity for generations to come and completes the life cycle of school garden plants. Keep in mind that not all plants in the garden will produce viable seeds, as many are hybrids whose offspring will not exhibit the same traits as the parent plant. The basic principle to successfully saving seeds is to let the seeds dry completely (or “senesce”) on the plant before trying to save them. If the seeds are not completely dry, they will be prone to rot once stored. If you want to learn more about seed saving, read Suzanne Ashworth’s book *Seed to Seed*.

MATERIALS

- A screened drying rack or stainless steel cookie sheet
- Stainless steel bowls
- Mason jars with holes punched in the tops
- Sticky labels

EASY SEEDS TO SAVE

Herbs: parsley, dill, fennel, cilantro/coriander

Lettuce

Legumes: beans, peas

Grains: wheat, barley, oats, quinoa, amaranth

Annual flowers: sunflowers, poppies, hollyhocks

DIRECTIONS

- Before you begin, identify the plants in the garden that are ready to have their seeds saved. The seeds will be dry and ready to fall to the ground. Select plants that have not cross-pollinated with others, unless you are trying to save hybridized seeds. Refer to *Seed to Seed* for more detailed seed saving guidelines.
- Pick the pod, seed head or other part of the plant that contains dry seeds and place them in stainless steel bowls.
- Find a comfortable place to sit and “thresh” the seeds. (Rub the seeds out of the other plant material, or “chaff.”) Remove any remaining plant material by blowing over the seeds. (This is called “winnowing.”)
- If the seeds are completely dry, place them in the mason jar and label it with the date the seeds were saved, the name of the crop and the variety. Store in a cool, dark, dry place.
- If the seeds are not completely dry, spread them out on the drying rack and place it in a well-ventilated area, out of the sunlight, where it will be safe from animals until the seeds are ready for storage.

PLANT ROOT EXPLORATIONS

AGES

6-10 years old

CONTRIBUTED BY

Hidden Villa

Los Altos Hills, California

www.hiddenvilla.org

© SHARON DANKS

In this two-part activity, students will study roots in the schoolyard and make a viewing box to study roots over time. Plant roots absorb water and nutrients and anchor the plant in the ground. Roots are typically found below the ground, but sometimes grow above ground to absorb water and nutrients from the air. There are many different types of roots including taproots, fibrous roots, cauline roots and tubercular roots. A taproot is a long central root that stores energy while firmly anchoring the plant. Fibrous root systems usually grow less deep but can extend a great distance to allow plants to find water and nutrients in a wider area. Cauline roots spread easily and help a plant cover a wide area (e.g. ivy). Tubercular roots, found on plants such as the sweet potato, grow out of the stem, branch, leaves or old woody root.

PART 1: EXPLORE ROOTS IN THE SCHOOLYARD

MATERIALS

- Garden trowels and gardening gloves (optional)
- 1 milk container (school lunch size) for each student

DIRECTIONS

- A great way to encourage students to explore different kinds of roots is to have them weed a portion of the schoolyard such as a garden pathway or other weedy playground space. Select a large, well-defined area to work on that does not contain any plants you want to keep. Clearly mark the boundaries of this selected area before you begin.
- Bring students outside and explain the activity. Demonstrate how to pull the weed by the stem base, as close to the ground as possible, so that the roots come up cleanly and remain intact. Use trowels as needed to loosen the soil.
- After students remove the plants from the ground, they should gently shake off the extra dirt and observe the roots they have in hand. Designate a space for students to put the weeds they find. Discuss the range of root types the class discovered.

PART 2: CREATE ROOT VIEWING BOXES

MATERIALS

- 1 clear plastic square (1.5" x 1.5") for each student, cut from transparency sheets or similar sturdy, clear plastic
- Scissors, tape, drawing paper, pencils
- Soil, seeds (e.g. sugar snap peas or radish), water

DIRECTIONS

- Preparation: Wash the milk cartons and open the flaps. Mark a 1" x 1" square on each container to show students where to cut.
- Ask students to cut a 1" x 1" square in the side of their carton, following the marked outlines, and then tape a 1.5"x1.5" piece of plastic across the hole. (Tape the plastic on both sides, inside & outside the container.)
- Fill each milk carton with soil and plant a radish or pea seed. Be sure students place their seeds near the side with the viewing square. (If planted too far back, students will not see the roots growing.) Place near a classroom window or outside in a protected area.
- Water the plants regularly and observe them weekly after the seeds sprout. Have students discuss and record their observations once a week for four weeks.

There's more to a plant than meets the eye! Use a trowel to dig up and investigate the root structures of numerous schoolyard plants—weeds! Uncover these varied below-ground structures (roots) and find out how they support the shoots, the visible parts of the plants.

MATERIALS

- For each group of 4 students: 1 trowel and hand lenses
- For the class: 4 marking flags, basin of water, plant with fibrous roots, plant with taproot, 2 opaque bags, marker, string

PREPARATION

- Find one weed (grass) with a fibrous root system. Wash roots and enclose the plant in an opaque bag so that only the roots are visible; label the bag “1”. Do the same for a plant with a taproot; label it “2”.

- Flag four different weeds growing in the schoolyard.

DIRECTIONS

- Gather students in a circle near one flagged plant. Pass around mystery plant “1” so students can closely examine the roots. Have students describe them. Point to a flagged plant and ask students to describe the shoot (the above-ground part of the plant including the stem, the branches, leaves and flowers).
- Explain that each group will carefully dig up several (2 to 4) different weeds (unwanted plants). Point out the four different flagged plants. Explain that students

should try to find a plant that matches one of the flagged plants, dig it up and rinse the roots in a basin of water.

- Following root extraction, call students to the sharing circle and display the collected roots and shoots. Ask questions about the roots they dug up.
 - Are some roots harder to get out of the ground?
 - Were you able to get all the roots out?
 - Why is it hard to get the roots out?
 - Was anything attached to the roots?
- Focus the discussion on root types.
 - Does anyone have a plant with roots like plant “1”?

Discuss similarities and then identify them as fibrous roots. Introduce mystery plant “2”. Ask for some descriptions of this root. Give students time to look at their roots to see if any are similar. Identify this as a taproot. Ask:

- What do roots do?
 - Which roots hold the most soil after they are out of the ground?
 - Do roots “branch” like shoots?
 - Shoots have stems, leaves, flowers and bark. Do roots have structures like these?
- Ask students to guess what the mystery plants will look like. Unveil the hidden plants. Compost the weeds and drain the dirty water onto a few plants.

In this activity, groups of students will search for objects in the garden that have a specific quality and those that have the opposite quality. Students use multiple senses to find and classify contrasting objects in the natural environment.

MATERIALS

- One egg carton per group of three students

PREPARATION

- On the bottom of each egg carton write two words. One should be a likely quality of a garden object, such as “wet.” The other should be its opposite (“dry”). Use words that will encourage students to use their senses, such as dark/light, rough/smooth, dull/colorful, scented/unscented, scratchy/ soft, etc. Label each carton with different opposites. To discourage unsupervised tasting, avoid opposites that refer to taste.

DIRECTIONS

- Divide the class into groups of three. Tell the class that each group will get a special collecting container in which to collect 12 items. They shouldn't let any other group see the secret information on the bottom of the carton.
- Distribute the cartons and demonstrate to each group how the opposites should be placed, with six of each category in a long row. On the bottom of the carton are secret words that tell what category of objects to collect. Every group will be collecting different opposites.
- Remind students to handle everything gently and to take only small specimens. Allow enough time for students to explore the site and gather the items.
- When the groups are finished, have them each exchange cartons and try to determine which opposite categories the other group collected, without looking on the bottom of their carton.
- Discuss strategies that groups used for identifying the other group's classifications.

© SHARON DANKS

Energy and Climate

School facilities use a substantial amount of energy for heat, light and power, and many school community members use fossil fuels to commute to school. Schools can engage students in reducing their facility’s energy footprint (and saving money), while teaching real-world lessons about where energy comes from and what it takes to produce and transmit power. Students can also be encouraged to walk and bike to school to reduce fossil fuel use. (Danks, 2010)

RENEWABLE ENERGY School grounds can host renewable energy demonstration systems that power decorative fountains—or the entire school—teaching children and their communities about clean and sustainable sources of energy.

CLIMATE IMPROVEMENT School ground design can address climate change and make the site more comfortable by removing pavement, which heats up in the sun, and by planting trees and shrubs to provide shade for students and school buildings. (Danks, 2/7/14).

CURRICULUM CONNECTIONS Living schoolyards with renewable energy systems that are accessible to students provide hands-on learning resources for science and other curricula. Art lessons can also be tied to basic understanding of the sun’s power to provide heat and light.

ACTIVITIES IN THIS CHAPTER

- *Make a Solar Etching* 49
Art project with science theme (8 years old and up)

MAKE A SOLAR ETCHING

AGES

8 years old and up

CONTRIBUTED BY

Rahus Institute - Solar Schoolhouse
Sebastopol, California
www.solarschoolhouse.org

© TOR ALLEN

Many years ago, people would start the family cooking fire using mirrors or glass to focus sunlight into a high temperature beam. The power of sunlight can also be used to make artistic creations with the aid of a magnifying glass. Solar Schoolhouse learned of this technique from Solar B, a Santa Barbara artist who ‘solar carves’ amazing artwork using only sunshine. You too can be a Solar Artist!

MATERIALS

- Magnifying glass (2x or 3x magnification, 4” diameter)
- Protective eyewear (welding goggles, Shade #5, 50mm)
- Pencils and 1 or more clean pieces of wood per student

DIRECTIONS

- Ask students to choose a piece of wood, and then draw or write something on the wood with pencil.
- Students should sit outside in a comfortable, sunny place, with the sun shining over the shoulder that matches the hand they use for writing (either to the right or left).
- Ensure that each student puts on protective eyewear before they begin to etch.
- Students should hold the magnifying glass with the lens perpendicular to the sun, above the wood.
- Slowly move the lens closer to the wood, making sure the light beam is a perfect circle, and focusing it until it gets as small as possible. It should start burning at this point. If the lens gets too close to the wood, the beam will start to enlarge and it will stop burning.
- To etch the design, move the beam in the direction of the pencil line, traveling slowly back and forth, and going further forward with each pass.
- As you can see in the picture, the lens bends the heat essence of the sun and concentrates it. On a clear day, the temperature of a totally focused beam can reach over 800 degrees Fahrenheit!! Do not allow this hot point of light to come in contact with students’ skin or flammable clothing. ALWAYS BE SAFE, and have fun!

INTRODUCTION TO RENEWABLE ENERGY

AGES

9-11 years old

CONTRIBUTED BY

Education Outside
San Francisco, California
www.educationoutside.org

© EDUCATION OUTSIDE

In this lesson, students learn about renewable energy and explore solar, wind and hydroelectric energy using hands-on models. Before using this activity, students should have already explored the concept of “energy” and its sources.

MATERIALS

- Whiteboard and markers
- Science notebooks
- Pinwheel supplies: unused pencils, pushpins, pinwheel template: www.nrel.gov/education/pdfs/pinwheel.pdf
- Model windmill generator
- Model solar panel or garden solar feature
- Model waterwheel: http://howto.wired.com/wiki/Build_a_Plastic_Cup_Waterwheel
- Posters or other information about renewable energy sources (solar, wind and hydro)
- Resources can be found at:
www.educationoutside.org/lesson-pathway-search

ADVANCE PREPARATION

- Write the word “renewable” on the white board.
- Set up three renewable energy stations with supplies, models and information about different energy sources.

DIRECTIONS

- Begin by asking students a few questions: What does the word renewable mean (able to be replaced by nature)? What are some examples of sources of energy that are non-renewable (burning oil, natural gas or coal)?
- Ask students to discuss forms of energy that are renewable with a partner, and list examples of naturally occurring energy in “nature” (waves, wind, sun, etc.). Take suggestions from volunteers to share with the class.
- Tell students that they are going to learn about three sources of renewable energy today: solar, wind and

hydropower. Using informational posters for help, discuss each form of renewable energy: What forms of renewable energy have students seen before? (a local dam? a wind farm? solar panels?) How do they work? Where does the energy come from and go?

- Divide students into three groups and have each group start at one of the stations. Give students 5-8 minutes at each station, depending on the time allowed.
- Wind Power Group: At this station, students will make pinwheels to demonstrate how a wind turbine works. They can also play with a model windmill generator.
- Solar Power Group: At this station students experiment with a solar powered fan or another schoolyard solar feature such as a solar powered pond pump, observing what happens when the panel is partially blocked.
- Hydropower Group: At this station students will use water from a hose or watering can (or a water feature, if the school garden is equipped with one) to rotate a waterwheel.
- After each group has had a chance to rotate through each station, reconvene the students and ask them to share one thing they learned about renewable energy with a partner. Ask one volunteer from each group to share their comment with the entire class.
- End the lesson by asking students to recap the lesson’s objectives in their science notebooks. Ask: What is the difference between renewable and non-renewable energy? What are three forms of renewable energy?

Thoughtful Use of Materials

Everything a school chooses to include in its environment says something about its values. Over the last two decades, as the green building movement has grown, many schools have started to question traditional playground materials— asphalt, concrete, stainless steel, plastic and rubber—that are widely used. Schoolyard landscape features designed using sustainable, natural and recycled building materials demonstrate green building practices to the school community and can reduce the school district’s costs and impact on landfills and other urban infrastructure. (Danks, 2010)

NATURAL MATERIALS Wood, bamboo, straw, stone, sand, clay, adobe, snow and other natural building materials are teaching tools for lessons about environmental stewardship and time-tested construction techniques that are still relevant today. They lend themselves well to artistic expression and to community participation in schoolyard construction and stewardship.

RECLAIMED AND RECYCLED MATERIALS Using salvaged building materials on school grounds diverts bulky waste from landfills and recaptures the remaining value of the materials for further use. It reduces the need to mine, harvest, process and transport new materials, which in turn, saves additional energy and effort, and preserves environments at the extraction source.

ACTIVITIES IN THIS CHAPTER

- *Think Before You Throw: 4Rs Recycling Race Game* (4-18 years old) 52
- *Compost Gourmet* Science / decomposition / soil health (5-10 years old) 53

- *Sheet Mulching: Turn Lawns into Native Gardens to Save Water* Horticulture / grounds improvement (9 years old and up) 39

THINK BEFORE YOU THROW: 4RS RECYCLING RACE

AGES

4-18 years old

CONTRIBUTED BY

Green Schools Initiative
Berkeley, California
www.greenschools.net

© GREEN SCHOOLS INITIATIVE

In this activity, children learn about what everyday products are made of and what happens when items come to the end of their useful lives. This includes learning about the 4Rs and how to sort their waste properly as compost, recycling and landfill trash to reduce their environmental impact on the Earth. Students practice sorting and have fun with a Recycling Relay Race.

MATERIALS

- A large bag with examples of waste students encounter at school, including at least 1 example of each type of waste (items to be composted, recycled and landfilled) per team. For example: used classroom paper, empty milk cartons, empty yogurt containers, paper napkins/towels, chip bags, paper plates, plastic bottles, aluminum cans, plastic forks and non-messy food waste (e.g. banana peels)
- Each team of students needs: 1 trash bin labeled “Landfill” (with a black bin or black sign), 1 recycling bin labeled “Recycling” (with a blue bin or sign), 1 compost bin labeled “Compost” (with a green bin or sign)

DIRECTIONS

- Preparation: Attach waste station signs to the bins and bring them outdoors. In the schoolyard, 5-10 yards from the bins, arrange 1 pile of mixed waste per team, to be sorted by students during the race. Each pile should have the same number of items and the same examples of waste to sort.
- Gather students outside near the prepared materials and tell them about the 4Rs. Ask if they’d like to be an Earth Protector (or other eco-hero). Tell them that everything we use is made with resources that come from the Earth—our clothes, houses, food, books, cars, computers, toys and iPhones (modify for age). When we are done using our things we often throw them “away.” Ask students: Where do things go when we throw them “away”? Answer: There is no such place

THE 4RS

REDUCE - Use fewer things, so less is wasted

REUSE - Use durable goods, not disposable ones

RECYCLE - Turn old materials into new ones

ROT - Compost organic matter to create rich soil

as “away” because we only have one Earth. It all goes somewhere—to the landfill, or a recycling plant or a compost pile. The less we use, and the less we bring to the landfill, the more we save resources, replenish soils and protect our Earth.

- Waste Sorting: Show an example of each item when you explain the activity. Ask what each item is made of and whether it can be recycled or composted (rotted) or whether it is landfill trash. Demonstrate where each item can be disposed of properly (in matching bin). Plastic items go to the landfill. Paper, bottles and cans can be recycled. Food-soiled paper, milk cartons and food waste can be composted. Tell students that it is important for them to “Think Before You Throw” and to practice the 4Rs. Ask the students if they understand the 4Rs.
- Recycling Relay Race: Divide students into teams and have them line up behind each waste pile. Each student will pick one item, race to their waste bins, and put the item in the proper bin (landfill, recycling, compost). When they return to their pile, the next student takes a turn. The team that completes the race first and gets the most items in the correct bins wins.

COMPOST GOURMET

AGES

5-10 years old

CONTRIBUTED BY

TreePeople

Beverly Hills, California

www.treepeople.org

© TREEPEOPLE

A forest, in order to thrive, needs nutrient-rich mulch (fallen leaves and branches) to be converted to healthy humus—exactly what trees and plants need to grow! Composting is our attempt to promote the process of decomposition by recycling our yard clippings, food scraps and other organic matter. Using compost to feed the soil, we can divert our organic matter from landfills and convert it into soil for our school and community gardens.

MATERIALS

- Mixing bowl, spoon and apron
- Baking pan filled with organic compost
- Container of water
- Separate bowls of dried leaves, branches, food scraps and grass clippings
- Compost bin (or picture)

DIRECTIONS

- Explain to students that they will observe a demonstration by the Compost Gourmet who specializes in turning trash into treasure!
- Ask the students, “What do you think is natural trash?”
- Set up a demonstration separating the bowls of items by “greens” (high in nitrogen—food scraps and grass) and “browns” (high in carbon—dried leaves and branches) including the mixing bowl, spoon and water.
- Wearing your apron, proceed as the “compost gourmet”. (Silly voice is optional.)

- Use the following script, modifying it as you choose:
I am going to show you how to turn what some people think is trash, into treasure! Look at these ingredients! What do we usually do with them? (Throw them away.) Not in my kitchen! All of these can be turned into compost. Compost is rich soil that is used to grow food and plants. Using a special recipe, I will mix these together to make compost. The perfect recipe calls for an equal blend of nitrogen and carbon. These are important elements for making soil. For our recipe we’ll call nitrogen-rich ingredients “greens.” Green ingredients are moist, like grass clippings, food scraps and garden weeds. (Display some samples.) The carbon-rich ingredients we’ll call “browns.” Brown ingredients are dry like bark, branches and dry leaves. (Display some samples.)
- Invite students to come up and add equal parts of green and brown ingredients to the mixing bowl, stirring it and adding water.
- Demonstrate that the last step is to put it in the oven. “Do you think I should put it in a regular oven?” Share that the ingredients for compost go into a compost bin (show the bin or a picture), and that it acts like an oven. All the micro-organisms work so hard to process this material, that the compost bin actually gets hot inside. In about 3 months we have our finished product—compost.
- Pull out a sample showing the baking pan filled with organic compost. Allow students to smell it, feel it and add handfuls of it below a tree.

© SHARON DANKS

Place-Based Understanding

Living schoolyards, built with local, natural materials and native plants, are each unique, reflecting the geography, ecology and culture of their community and building a sense of place for children and adults who spend time in them.

NATURAL CONTEXT Green schoolyards can showcase local ecosystems in their region, helping children to connect on a daily basis to the living systems that surround them.

GEOGRAPHIC CONTEXT Large painted or three dimensional maps of many types can be added to schoolyards to illustrate the school's location in the world, the country, the state, the city, the neighborhood or even their watershed.

CULTURAL CONTEXT California's school communities have incredibly rich cultural diversity which can be celebrated in living schoolyards with art, events and activities that reflect the school's population and context.

COMMUNITY ENGAGEMENT AND STEWARDSHIP The process of building and sustaining green schoolyards connects communities to place, and helps to engage students, teachers, staff, parents, neighbors, businesses, nonprofits, public agencies and others in collaborations to improve their school grounds and surrounding areas.

ACTIVITIES IN THIS CHAPTER

- *Finding Your Place in the World* 55
Nature journaling / outdoor observation (4-18 years old)
- *Create a Schoolyard Site Survey Map* 56
Mapping / place-based study (5-18 years old)
- *Exploring Our Relationship to Place* 57
Place-based study / observation (5-18 years old)
- *Reflection Writing in Your Green Schoolyard* 58
Place-based study / observation (7-18 years old)

OTHER RELATED ACTIVITIES

- *Family Camp Out in the Schoolyard* 21
Family time (6-17 years)
- *Butterfly Habitat Hunt* 30
Schoolyard ecology (5-12 years old)
- *Documenting Biodiversity in Your Schoolyard* 36
Scientific lesson / place-based study (9-18 years old)

FINDING YOUR PLACE IN THE WORLD

AGES

All ages

CONTRIBUTED BY

The Presidio Trust
San Francisco, California
www.presidio.gov

© THE PRESIDIO TRUST

This “activity” is remarkably simple yet potentially profound, and gets more valuable if it can become a regular part of a weekly or monthly routine. The power of observation relies on the conditions of settling the mind, tuning the senses and sparking curiosity. By giving each student their own space (or “place in the world”) and singular task to simply notice what is happening, students develop a practice they can bring with them anywhere they go outdoors.

MATERIALS

- No materials are necessary for this activity, however it lends itself to on-going field journaling practice (drawing and writing observations, questions, musings, etc.)

DIRECTIONS

- Identify an outdoor area that is large enough for students to have a personal sitting space at least 10 feet from other students. This can be an area that is new to them or one that they are already familiar with. (If the latter, this can be presented as a challenge for them to notice something new that they had been previously unaware of.) Ideally students will be invited to find their own sitting spot, with the understanding that this is not a talking activity.

- The initial length of time for their observations can be as short as 3-5 minutes. If this activity becomes a regular part of a weekly routine its duration can be increased in response to students’ capacities and interests. There is value in returning to the same sitting spot over time so that phenological changes can be noticed (changes in natural phenomena, e.g. the changing growth phases of a plant). Afterwards, invite students to share their insights and surprises. This discussion with an interested adult adds a vital component to their connection with the natural world.
- There are many activities teachers can do with their students to extend this activity such as:
 - Make a sound map of the area around each student
 - Engage a “See-Think-Wonder” inquiry: Focus on one thing that interests students. Encourage them to write about it and pose related questions.
 - Write a poem (haiku or cinquain)
 - Ask students to write a letter to themselves from the perspective of a plant or animal in their space
 - For older students, ask the following questions related to values in decision-making about human impacts on a place: What has happened here? What is happening here? What should happen here?
- If journaling, invite students to “dialogue journal” with a partner to share questions and observations. Alternatively, invite students to bring their journal home so their parents can engage in the dialogue with their own questions.

CREATE A SCHOOLYARD SITE SURVEY MAP

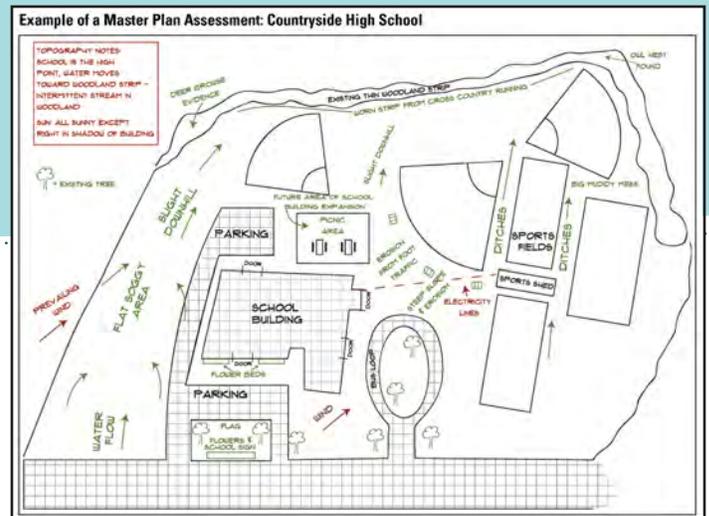

AGES

5-18 years old

CONTRIBUTED BY

U.S. Fish & Wildlife Service
Sacramento, California

www.fws.gov/cno/conservation/schoolyard.cfm

A schoolyard site survey takes students on a journey around the campus to identify areas used by people, both formally and informally, physical features of the campus, and human-related and biological characteristics of the site.

MATERIALS

- U.S. Fish & Wildlife Service’s *Schoolyard Habitat Project Guide*, see: www.fws.gov/cno/pdf/HabitatGuideColor.pdf
- All available maps and images of the school
- Camera
- Measuring tape
- Field guides
- Binoculars
- Pencils, markers and graph paper

DIRECTIONS

- Draw an outline of the school property, school buildings and parking lots. This is your base map.
- Walk the entire schoolyard.
- Sketch on your base map all of the important physical, human related and biological characteristics listed below. Create a legend and designate symbols to mark important characteristics.
- Create a collective schoolyard site survey that includes observations from the whole class about the following features:
 - **TOPOGRAPHY:** Identify high and low spots. Locate steep slopes.
 - **PREVAILING WIND:** Indicate prevailing wind direction.
 - **SUNNY AND SHADY AREAS:** Distinguish between areas that receive full sun, partial shade and full shade.
 - **WATER:** Designate any areas that are obvious drainage or waterways. Indicate direction of water runoff. Locate any areas where erosion is occurring. Locate spots that seem especially wet or dry.
 - **STRUCTURES:** Identify structures where students play or gather such as playground equipment, bike racks, signs, benches, picnic tables and fences.
 - **FIELDS:** Identify the athletic fields and areas that are used for informal play either by the school or other members of the community. Identify where students gather for fire drills.
 - **ACCESSIBILITY:** Identify areas that are accessible during a class period. Indicate formal and informal pathways. Identify spaces used by the public.
 - **UTILITY FEATURES:** Locate obvious utility lines above or below ground. Locate existing water or irrigation lines and accessible spigots.
 - **PLANTS:** Locate and identify trees, shrubs and plants that provide food and cover for wildlife, both on and adjacent to the school grounds.
 - **WILDLIFE:** Locate and identify signs of wildlife on the school grounds.
 - **GROUNDCOVER:** Indicate different groundcovers such as grass, bare earth, pavement, woodland groundcovers, native plantings or garden areas.
- Discuss your observations and completed schoolyard map with the class and with the rest of the school.

EXPLORING OUR RELATIONSHIP TO PLACE

AGES

9 years old and up

CONTRIBUTED BY

Occidental Arts and Ecology Center
Occidental, California
www.oaec.org

© SASHWA BURROUS

This activity examines our relationships with place, people, all living beings and the “things” we interact with each day, building and re-learning ecological literacy. “Eco” comes from the Greek word *oikos* which means home. Ecology is the study of home. Economy is the management of home. Ecosystems are the web of connections at home. This place-making activity sets the stage for long term observations of the ways in which we are in a relationship with home.

DIRECTIONS

- Stand in a circle in the schoolyard. The facilitator supports participants in establishing the cardinal directions by instructing, “on the count of three, point to where the sun rose this morning.” Ask participants to hold their pointing arms still while they look around at the varied responses. Ask 2-3 people to provide an explanation of why they are pointing in the direction they chose, highlighting observation, memory and gut feeling as common responses.
- Without revealing the answer, use the participants’ co-created knowledge to establish the cardinal directions. Once group has established N/S/E/W, “create” (or imagine) an oriented, flat map on the ground with clear boundaries, an equator and a center point. You may draw a line in the dirt (or use chalk on asphalt) or use reference points to establish boundaries.
- Participants will soon physically place themselves on the map according to their personal responses to the facilitator’s prompts. Acknowledge that scale will vary depending on the question. After each prompt is (silently) responded to through physical motion, ask 3-5 participants to tell the group where they are. Set the pattern by asking students to introduce themselves and share their response with a brief story, if appropriate. The student sharing their response then calls on the next student. The facilitator monitors the discussion and prompts with the additional questions.
- Sample prompts for this mapping activity include: Place yourself on the map where you call “home.” Place yourself on the map where—to the best of your knowledge—your mother’s ancestors are from. Place yourself on the map where—to the best of your knowledge—your father’s ancestors are from. Place yourself on the map where you first felt a connection to the natural world. Place yourself on the map where some of the materials in your cell phone were extracted. Place yourself on the map where your shirt was made. (Ask a partner for some help in reading the tag.) Place yourself on the map where your favorite food is from. Place yourself on the map where you would like to travel one day. Design your own prompts in order to meet the needs of your community.
- To debrief, stand in a circle. Raise your hand if you: liked that exercise; were ever confused during that exercise; learned something about yourself/the group during that exercise; had to travel during that exercise; felt heard during that exercise; have more stories to share.
- Discussion prompts: What came up for you? What did you learn about your community? Surprises? Similarities? Differences? How are we all connected? To each other? To land? To food? To water? What networks did you observe? What systems connect us?
- Summary: This activity is about building community amongst participants (unexpected commonalities and differences) and rooting our personal experiences in deeper relationship with place in order to better understand home. We are global citizens.

REFLECTION WRITING IN YOUR GREEN SCHOOLYARD

AGES

7-18 years old

CONTRIBUTED BY

Nature's Voices, Green Schools Initiative
Berkeley, California
www.naturesvoices.org

© NATURE'S VOICES

This activity links to the Language Arts Common Core Standards by asking students to reflect upon why green schoolyards are important to their school. Students choose their favorite spot in the schoolyard, then use a prompt to write about the benefits of green schoolyards for themselves and their school. These essays can be published on the Nature's Voices website and on other community platforms to showcase student stories about green schoolyards.

MATERIALS

- Pen, paper and clipboard for each student
- Computers access to publish the stories on the Nature's Voices website, listed above.

DIRECTIONS

- Tell the class that May is Living Schoolyard Month and that they will be brainstorming, writing about and then publishing stories about the many reasons why their green schoolyard is so important to them.
- Begin by taking students on a tour of the schoolyard, stopping at all of the students' favorite spots and reflecting on why these places are special. The teacher can designate a note-taker to record comments during the walk.
- Gather the class and lead a discussion to reflect on the site tour. The discussion might include questions like this:
 - Name some of your favorite places on the school grounds and tell us why they are so special to you?
 - What are some of the benefits of green schoolyards? Students might say: nature calms them down; they love that their school is protecting the environment; or they have fun playing in nature at school.
 - How does the green schoolyard help the community? Ideas might include that the school is saving water, growing food or planting trees.
- Should other schools have green schoolyards like the one at your school? If so, why?
- Are there other elements that students would like their schoolyard to include, to make it even greener?
- Teachers continue the lesson by giving each student a clipboard to write an essay that summarizes what they were thinking about during the discussion. Students choose their favorite place in the schoolyard, sit down there and write for 15-20 minutes. The general writing prompt might be: "Why I Love My Green Schoolyard" or "What My Green Schoolyard Means to Me."
- After students have completed the first draft of their essays outside, the teacher can later use them to teach or practice the writing process by creating edited revisions. Students may also illustrate their writing with photographs or drawings.
- With their teachers' assistance, students can publish their completed stories and images on the Nature's Voices website. This website, listed above, is a storybank of written work, photographs and videos from and about youth, who share their thoughts related to their environmental and outdoor experiences.
- Students and teachers can also brainstorm other ways to share their stories, from publishing their essays in the school or community newspaper to sharing them on the school's website.

Directory of Contributing Organizations

This *Guide* is the result of a fruitful collaboration between Green Schoolyards America and forty-one organizations across the state of California, who each contributed a schoolyard activity that reflects their own organization's mission and programs. The diversity of ideas they shared will now enrich school ground programs across California and beyond. We greatly appreciate everyone's participation and extend our sincere and heartfelt thanks.

green schoolyards america : Living Schoolyard Month
greenschoolyardsamerica.org : Activity Guide 2015

GREEN SCHOOLYARDS AMERICA

Green Schoolyards America is a national organization that expands and strengthens the green schoolyard movement and empowers Americans to become stewards of their school and neighborhood environments. We believe that school grounds are uniquely positioned to enrich the daily lives of children and their communities, occupying both the geographic and social heart of almost every city across the USA and around the world.

Green Schoolyards America facilitates public dialogue about innovative research, design, education and policy and fosters partnerships between professionals and organizations across the USA and around the globe. Our programs promote the green schoolyard movement, build relationships that help it succeed and work to embed this paradigm shift in our existing institutions and national policy and regulatory frameworks.

We value the uniqueness of each school and celebrate local sense of place while promoting learning, environmental sustainability, lifelong health, recreation and community engagement. We believe strongly in the value of student and community participation in schoolyard design, construction and stewardship.

We provide resources, training and support for school districts and partner with nonprofits, businesses, public agencies and utilities to effect change across the USA.

We help educational institutions develop comprehensive, district-wide green schoolyard programs with strong connections to local sustainable-city planning efforts, regional ecosystems, educational standards and health.

We work with school districts to develop site-specific support systems, programs and operational strategies to help them adopt and sustain living schoolyards.

We invite like-minded professionals and organizations to join us in this work and collaborate to nurture and grow the international movement to green school grounds.

Green Schoolyards America is fiscally sponsored by Architects/Designers/Planners for Social Responsibility, a 501(c)(3) corporation.

HOW CAN YOU GET INVOLVED?

Public support is very important to the success of the green schoolyard movement across the country. We hope you will get involved with living schoolyards your local area.

PARTICIPATE IN LIVING SCHOOLYARD MONTH

- Wherever you live, we hope you will participate in California's celebration of Living Schoolyard Month this year and send us information about your work. (Please see page 6 for the details.)
- Encourage your city government and school district to adopt a Living Schoolyard resolution like California's: www.bit.ly/1sZv2sc
- If your organization is based in California and you would like to contribute an activity to next year's version of this guidebook, please send us an email to request more information: info@greenschoolyardsamerica.org

INVITE US TO HELP YOU!

- Please contact Green Schoolyards America if you'd like to bring living schoolyards to your school district or region: info@greenschoolyardsamerica.org
- We would be happy to work with organizations across the country to establish Living Schoolyard month celebrations in your state.
- We encourage you to visit our website for more information and to sign up for our mailing list.
- For more information about how to transform your school grounds from traditional asphalt and grass to a living schoolyard, visit your local library to read our book, *Asphalt to Ecosystems*, or purchase it from our nonprofit publisher, New Village Press: www.newvillagepress.net
